List of Tables

60 V / 1.5 A High Efficiency Step-Down LED Driver

1   Features

- Wide input voltage range from 4.5 V to 60 V
- Capable to provide up to 1.5 A average output current
- Up to 1 MHz switching frequency
- Soft-start capability
- Separate enable and PWM dimming pins
- Analog and PWM dimming possible
- Integrated PWM generator for analog dimming input
- Typical 3% output current accuracy
- Very low LED current drift over temperature
- Adjustable over-temperature protection
- Undervoltage lockout
- Over-current protection
- Thermally optimized package: PG-DSO-8-27

RoHS ✓
Applications

- LED driver for general lighting
- Retail, office and residential downlights
- Street and tunnel lighting
- LED ballasts

Product Name	Package	Marking
ILD6150	PG-DSO-8-27	ILD6150

2 Product Brief

The ILD6150 is a hysteretic buck LED driver IC for driving high power LEDs in general lighting applications with average currents up to 1.5 A.

The ILD6150 is suitable for LED applications with a wide range of supply voltages from 4.5 V to 60 V. The enable signal can be used to activate the standby mode. A multifunctional PWM input signal allows dimming of the LEDs with an analog DC voltage or an external PWM signal. To minimize colorshifts of the LEDs an analog PWM voltage is converted to an internal 1.6 kHz PWM signal modulating the LED current.

The ILD6150 incorporates an undervoltage lock-out that will shut down the IC when the minimum supply voltage threshold is exceeded. The over-current protection turns off the output stage once the output current is above the current threshold. An integrated over-temperature protection circuit will start to reduce the LED current by internal PWM modulation once the adjustable junction temperature threshold of the IC is exceeded. Realizing a thermal coupling between LED driver and LEDs this feature eliminates the need of external temperature sensors as NTCs or PTCs.

Thanks to the hysteretic concept the current control is extremely fast and always stable. A maximum contrast ratio of 3000:1 can be achieved depending of the dimensioning of the external components. The efficiency of the LED driver is remarkable high, reaching up to 98% of efficiency over a wide range. The output current accuracy from device to device and under all load conditions and over temperature is limited to a minimum, making ILD6150 the perfect fit for LED ballasts.

Pin Definition

Table 1   Pin Definition and Function

Pin No.	Name	Pin Type	Buffer Type	Function
1	EN	Input	–	**IC enable signal**
2	PWM	Input	–	**Dimming signal:** • Analog dimming • PWM dimming
3	GND	GND	–	**IC ground**
4	GND	GND	–	**IC ground**
5	Vswitch	Output	–	**Power switch output**
6	Vsense	Input	–	**LED current sense input**
7	VS	Input	–	**Supply voltage**
8	Tadj	Output	–	**Over-temperature adjustment**
EP	Exposed Pad	GND	–	**IC ground and heat spreader**

3 Maximum Ratings

Table 2   Maximum Ratings

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Supply voltage	V_S	-0.3	–	60	V	–
EN voltage	V_{EN}	-0.3	–	60	V	–
PWM voltage	V_{PWM}	-0.3	–	5.5	V	–
Tadj voltage	V_{Tadj}	-0.3	–	3.5	V	–
Sense voltage	V_{sense}	V_S - 0.3	–	V_S	V	–
Switch voltage	V_{switch}	-0.3	–	60	V	–
Average switch output current	I_{out}	–	–	1.5	A	–
Total power dissipation, $T_S \leq 116°C$	P_{tot}	–	–	2	W	–
Junction temperature	T_J	-40	–	150	°C	–
Storage temperature range	T_{STG}	-65	–	150	°C	–
ESD capability at all pins[1]	$V_{ESD\ HBM}$	–	–	2	kV	HBM acc. to JESD22 - A114

1) Two different classes of ESD protection elements are implemented within ILD6150:
   1. ESD protection at pin 7 (V_S) gets triggered once the slew rate of the applied voltage signal exceeds a threshold of approximately 10 V/ns. In this case ESD protection will be triggered independently from the applied voltage level and won't turn off until supply voltage gets zero. If ESD protection gets triggered while V_S is supplied the ESD protection respective the IC might be damaged. Therefore a V_S blocking capacitor close to pin 7 is required to keep the slew rate at pin 7 below the threshold and to filter events as turning on the supply voltage or V_S voltage spikes.
   2. ESD protection at all other pins is triggered once the connected voltage signal exceeds a threshold higher than the maximum voltage rating specified for each pin. No preventions regarding slew rate control need to be taken for these pins.

Attention: Stresses above the max. values listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit.

4 Thermal Characteristics

Table 3   Maximum Thermal Resistance

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	**Typ.**	**Max.**		
Junction - soldering point[1]	R_{thJS}	–	17	–	K/W	–

1) For calculation of R_{thJA} please refer to application note AN077 (Thermal Resistance Calculation)
Figure 2   Total Power Dissipation

The major part of the IC power dissipation is caused by the switch resistance in conductive state. Therefore **Equation (1)** is a first estimation to calculate the total power dissipation of the IC

$$P_{tot} = R_{ON} \cdot I_{out}^{2} \cdot D + I_S \cdot V_S \tag{1}$$

D: Duty cycle of the output switch

For a more precise analysis measure the soldering point temperature T_S of ILD6150 at GND pin and use **Figure 2** as a reference.

5 Electrical Characteristics

5.1 DC Characteristics

All parameters at T_{amb} = 25 °C, unless otherwise specified.

Table 4   DC Characteristics

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Operating supply voltage	V_S	4.5	–	60	V	–
Under Voltage Lock Out	$V_{S, UV, off}$	4.05	4.25	4.45	V	IC deactivated[1]
	$V_{S, UV, on}$	4.15	4.35	4.50	V	IC operative
Supply current consumption open load $V_S = V_{sense}$, I_{LED} = 0 mA	$I_{S, OL, 4.5V}$	1.55	2.1	2.65	mA	V_S = 4.5 V
	$I_{S, OL, 12V}$	1.60	2.2	2.70	mA	V_S = 12 V
	$I_{S, OL, 60V}$	1.60	2.24	2.80	mA	V_S = 60 V
Supply voltage reset time	$T_{S, reset}$	105	160	210	µs	Reset time after V_S power up[2]
Supply standby current consumption	$I_{S,stby,12V}$	–	0.2	–	mA	$V_S = V_{sense}$= 12 V V_{EN} = 0 V
	$I_{S,stby,60V}$	–	0.5	–	mA	$V_S = V_{sense}$= 60 V V_{EN} = 0 V
Current of V_{sense} input	I_{sense}	12	17	22	µA	At any LED current
Output over current protection threshold	$I_{out, OCP}$	2.2	2.5	2.9	A	
Output over current protection delay time	$t_{delay, OCP}$	160	220	300	ns	turn off delay
Output over current protection time out	$t_{timeout, OCP}$	30	57	–	µs	turn off duration[3]
Over temperature protection threshold range (typical), 10 % reduction	$T_{OTP, range}$	75	–	145	°C	R_{Tadj} = 35 kΩ ... 0 Ω[4]
Over temperature protection threshold open, 10 % reduction	$T_{OTP, open}$	–	115	–	°C	R_{Tadj} ≥ 150 kΩ
Over temperature protection threshold short, 10 % reduction	$T_{OTP, short}$	–	145	–	°C	R_{Tadj} = 0 Ω
Over temperature protection, turn off	$T_{OTP, off}$	–	160	–	°C	
Tadj pin current source to GND	$I_{Tadj, short}$	-75	-60	-45	µA	R_{Tadj} = 0 Ω[5]

1) IC gets deactivated once the supply voltage drops below $V_{S, UV, off}$ and gets operative once supply voltage rises above $V_{S, UV, on..}$

2) Reset timer starts after supply voltage exceeds the lower limit of the supply voltage. Output stage gets enabled once reset timer expires.

3) Once the over current protection threshold has been exceeded the output switch gets disabled. It's enabled again once the time out expired.

4) $T_{OTPÜ, range}$ specifies the typical temperature tuning range achieveable at a 10 % reduction of LED current using resistors with 1 % accuracy. Temperatures specified refer to junction temperature on chip. Accuracy of the temperature sensor is typical ±5 K. Any resistor value R_{Tadj} ≥ 0 Ω can be selected for but it might not influence OTP temperature if out of the ranges specified.

5) Definition of current reference: Currents flowing out of the IC have a negative magnitude.

ILD6150 has an integrated over temperature protection based upon the junction temperature on chip. The threshold of the over temperature protection circuit is tuneable by resistor R_{Tadj} connected from pin Tadj to GND. R_{Tadj} resistor values within 0 to 35 kΩ define the over temperature protection behaviour as shown in **Figure 5**. R_{Tadj} values ≥ 150 kΩ set the OTP threshold to $T_{OTP, open}$. The over temperature protection is based upon modulation of the LED current with an internal PWM generator. Once the junction temperature exceeds the OTP threshold the PWM duty cycle as well as the average LED current will get reduced. Once junction temperature reaches $T_{OTP, off}$ the PWM duty cycle and LED current will be reduced to zero.

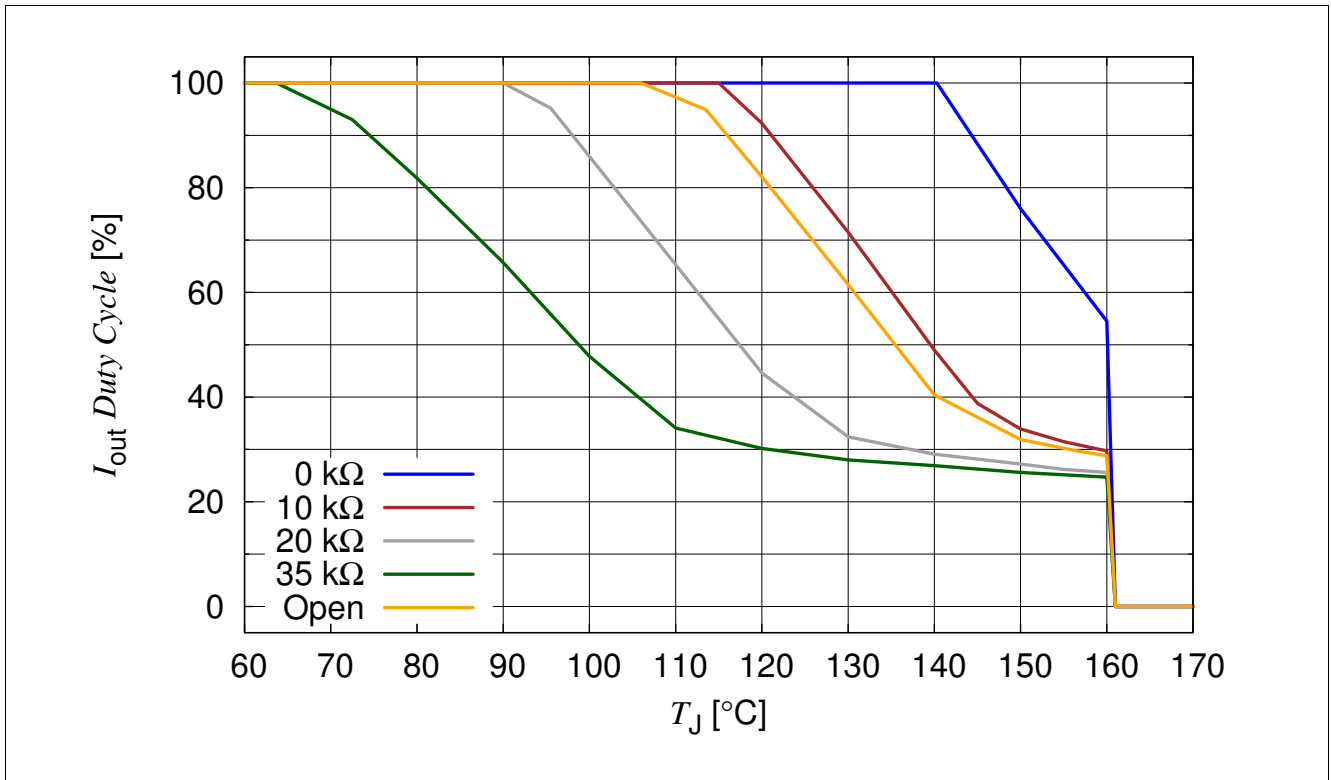

Figure 3   **Typical Output Current Duty Cycle of Over Temperature Protection vs. T_J and R_{Tadj}**

5.2 Switching Characteristics

All parameters at T_{amb} = 25 °C, unless otherwise specified.

Table 5   Switching Characteristics

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	**Typ.**	**Max.**		
Switching frequency	f_{switch}	–	–	1	MHz	
Mean current sense threshold voltage	V_{sense}	–	152	–	mV	f_{switch} = 100 kHz
Sense threshold hysteresis	$V_{sensehys}$	–	±22	–	%	peak to average V_S = 12 V f_{switch} = 100 kHz
Output current variation over supply voltage	$I_{out, Vs}$	–	±3	–	%	
Output current variation over temperature	$I_{out, Ts}$	–	±4	–	%	for temperatures below OTP threshold
Output current variation over load	$I_{out, load}$	–	±3	–	%	fixed V_S
Switch on resistance	$R_{ON, 25°C}$	0.2	0.23	0.26	Ω	I_{SW} = 1 A, T_J = 25 °C
	$R_{ON, 125°C}$	0.29	0.34	0.39	Ω	I_{SW} = 1 A, T_J = 125 °C

5.3 Digital ControlSignals

All parameters at T_{amb} = 25 °C, unless otherwise specified.

Table 6   Digital Control Parameter at Enable Pin EN[1)]

Parameter	Symbol	Values			Unit	Note /
		Min.	**Typ.**	**Max.**		**Test Condition**
EN voltage logic high level	$V_{EN, high}$	2.5	–	60	V	IC operative
EN voltage logic low level	$V_{EN, low}$	-0.3	–	0.5	V	IC in standby
Input current of EN pin	$I_{EN, 3V}$	7	11	15	µA	V_{EN} = 3 V
	$I_{EN, 60V}$	35	55	70	µA	V_{EN} = 60 V

1)   EN pin doesn't have an internal biasing and requires connection to an external voltage signal for operation

Dimming of the LED current can be achived by an analog or digital input voltage connected to pin PWM. A digital input signal will modulate the LED current according to **Table 7**.

Table 7   Digital Control Parameter at Pin PWM[1)]

Parameter	Symbol	Values			Unit	Note /
		Min.	**Typ.**	**Max.**		**Test Condition**
PWM voltage logic high level	$V_{PWM, high}$	2.6	–	5.5	V	output stage enabled
PWM voltage logic low level	$V_{PWM, low}$	-0.3	–	0.5	V	output stage disabled
PWM output current	$I_{CC,PWM}$	-23	-18	-12	µA	V_{PWM} = 0 V
PWM delay time	$t_{d, PWM, on}$	–	0.8	–	µs	V_{EN} = 3 V V_{PWM} = rising to 2.5 V V_{switch} = falling to 1 V
	$t_{d, PWM, off}$	–	0.6	–	µs	V_{EN} = 3 V V_{PWM} = falling to 0.5 V V_{switch} = rising to 1 V
PWM signal frequency	$f_{PWM, ext}$	–	–	25	kHz	

1)   PWM pin has an internal pull-up circuit to high level if not connected externally on PCB
Figure 4   PWM Input

An analog input voltage activates modulation of the LED current by the integrated PWM generator running at frequency $f_{PWM, int}$. Its duty cycle corresponds to analog PWM control voltage as shown in **Table 8** and **Figure 5**.

Table 8   Analog Control Parameter at Pin PWM

| Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	**Typ.**	**Max.**		
PWM input voltage for 0% duty cycle	$V_{PWM, 0\%}$	–	0.61	–	V	
PWM input voltage for 50% duty cycle	$V_{PWM, 50\%}$	–	1.52	–	V	
PWM input voltage for 100% duty cycle	$V_{PWM, 100\%}$	–	2.43	–	V	
Sensitivity of PWM duty cycle vs. PWM input voltage	D.C./V_{PWM}	–	55	–	%/V	
Integrated PWM generator frequency	$f_{PWM, int}$	1.2	1.6	2.1	kHz	

**Figure 5   Typical Integrated PWM Duty Cycle vs. PWM Control Voltage**

5.4   Switching Parameters

For all shown switching parameters ILD6150 has been measured on evaluation board ILD6150 at T_A = 25 °C. Used LEDs have a typical V_{fLED} of 3 V. Efficiency figure shows total efficiency of the application board including losses of external components as inductor or Schottky diode. See the application note for further details.

Performance vs. supply voltage and number of LEDs: R_{sense} = 100 mΩ, L = 47 µH, V_{fLED} = 3 V
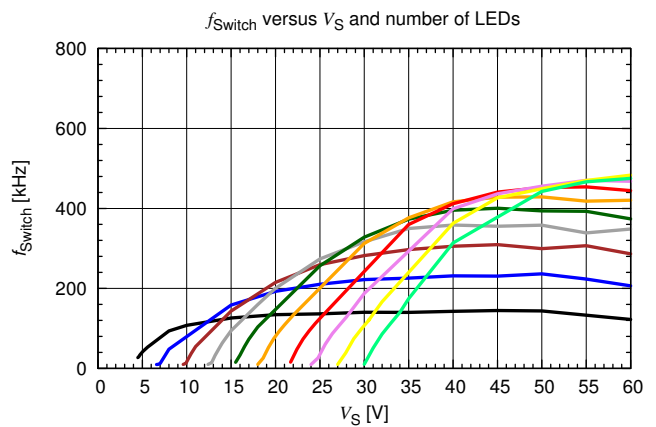

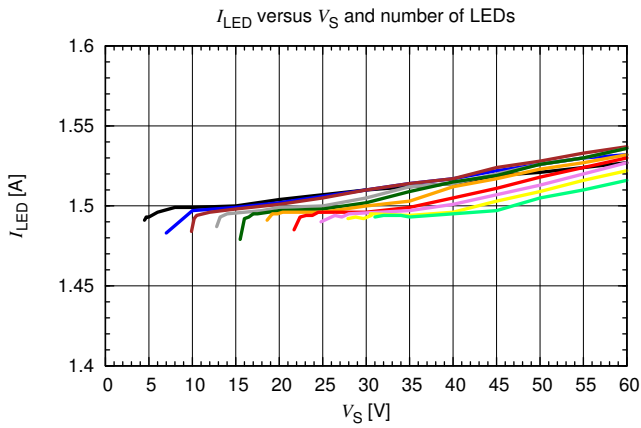

I_{LED} versus V_S and number of LEDs

Relative change of I_{LED} versus V_S and number of LEDs

6 Application Circuit

Figure 6   Application Circuit

A V_S blocking capacitor shall be placed close to pin 7 to enable a low ripple V_{sense} measurement and to avoid a false triggering of the V_S ESD protection element inside the IC.

6.1 Setting the average LED current

The average output current for the LEDs is set by the external sense resistor R_{sense}. To calculate the value of this resistor a first approximation can be calculated using **Equation (2)**.

V_{sense} is slightly dependent on the supply voltage V_S and the number of LEDs as shown in **Chapter 5.4**.

$$R_{sense} = \frac{V_{sense}}{I_{LED}}$$

(2)

Example calculation

V_S = 12 V, 47 µH, V_{fLED} = 3 V, 3 LEDs in series
$\rightarrow V_{sense}$ = 152 mV
I_{LED} = 1.5 A
$\rightarrow R_{sense}$ = 101 mΩ

An easy way to achieve these resistor values is to connect standard resistors in parallel.

6.2 Inductor Selection Guideline

The inductance of the inductor L, the supply voltage V_S, the number of LEDs driven and their average LED current significantly influence the slew rate of the LED current in on and off condition of the LED driver output switch. Due to the hysteretic current control ILD6150 will toggle the output driver stage each time upper or lower current threshold are reached. To maintain best regulation capability of the LED driver it's reasonable to keep a margin to the minimum switch on and off time defined by internal propagation delay times. Disregard of this recommendation by choosing too small inductor values might result in an increased LED current ripple and loss of LED current regulation accuracy.

Minimum 350 ns on and off time are recommended as a reasonable design target for the inductor selection. Below figures provide a guideline concerning minimum inductance value versus supply voltage and number of LEDs. It is assumed that the forward voltage of each LED is within a range of 2.5 V to 3.9 V over temperature and LED production tolerances. Minimum forward voltage (e.g. occuring at high LED temperatures) needs to be considered with respect to the minimum switch on-time while maximum forward voltage (e.g. occuring at low temperatures) needs to be considered with respect to the switch off-time.

The saturation current of the chosen inductor has to be higher than the peak LED current and the rating of it's continous current needs to exceed the average LED current.

Figure 8   Minimum Inductance for 0.7 A Average LED Current

1.5 A	Number of LEDs														
V$_S$ [V]	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
5	4.7														
10	6.8	10													
15	10	10	10												
20	15	10	10	15											
25	15	15	15	15	15	22									
30	22	22	15	15	15	22	22								
35	22	22	22	22	15	22	22	22							
40	33	33	22	22	22	22	22	22	33	33					
45	33	33	33	33	22	22	22	22	33	33	33				
50	33	33	33	33	33	33	22	22	33	33	33	33			
55	47	33	33	33	33	33	33	33	33	33	33	33	47		
60	47	47	47	33	33	33	33	33	33	33	33	33	47	47	47

Inductance in µH; 2.5 V ≤ V$_{fLED}$ ≤ 3.9 V
