

# 1.35V DDR3L SDRAM VLP RDIMM

## MT9KDF25672PZ – 2GB

### Features

- DDR3L functionality and operations supported as defined in the component data sheet
- 240-pin, very low profile, 18.75mm, registered dual in-line memory module (VLP RDIMM)
- Fast data transfer rates: PC3-12800, PC3-10600, PC3-8500, or PC3-6400
- 2GB (256 Meg x 72)
- $V_{DD} = 1.35V$  (1.283–1.45V)
- $V_{DD} = 1.5V$  (1.425–1.575V)
- Backward compatible to  $V_{DD} = 1.5V \pm 0.075V$
- $V_{DDSPD} = 3.0$ – $3.6V$
- Supports ECC error detection and correction
- Nominal and dynamic on-die termination (ODT) for data, strobe, and mask signals
- Single-rank
- On-board I<sup>2</sup>C temperature sensor with integrated serial presence-detect (SPD) EEPROM
- 8 internal device banks
- Fixed burst chop (BC) of 4 and burst length (BL) of 8 via the mode register set (MRS)
- Gold edge contacts
- Halogen-free
- Fly-by topology
- Terminated control, command, and address bus

Figure 1: 240-Pin RDIMM (MO-269 R/C K)

Module height: 18.75mm (0.738in)

### Options

- Operating temperature
  - Commercial ( $0^{\circ}C \leq T_A \leq +70^{\circ}C$ )
- Package
  - 240-pin DIMM (halogen-free)
- Frequency/CAS latency
  - 1.25ns @ CL = 11 (DDR3-1600)
  - 1.5ns @ CL = 9 (DDR3-1333)
  - 1.87ns @ CL = 7 (DDR3-1066)

### Marking

None  
Z  
-1G6  
-1G4  
-1G1

## Pin Descriptions

The pin description table below is a comprehensive list of all possible pins for all DDR3 modules. All pins listed may not be supported on this module. See Pin Assignments for information specific to this module.

**Table 5: Pin Descriptions**

Symbol	Type	Description
Ax	Input	<b>Address inputs:</b> Provide the row address for ACTIVE commands, and the column address and auto precharge bit (A10) for READ/WRITE commands, to select one location out of the memory array in the respective bank. A10 sampled during a PRECHARGE command determines whether the PRECHARGE applies to one bank (A10 LOW, bank selected by BAx) or all banks (A10 HIGH). The address inputs also provide the op-code during a LOAD MODE command. See the Pin Assignments table for density-specific addressing information.
BAx	Input	<b>Bank address inputs:</b> Define the device bank to which an ACTIVE, READ, WRITE, or PRECHARGE command is being applied. BA define which mode register (MR0, MR1, MR2, or MR3) is loaded during the LOAD MODE command.
CKx, CKx#	Input	<b>Clock:</b> Differential clock inputs. All control, command, and address input signals are sampled on the crossing of the positive edge of CK and the negative edge of CK#.
CKEx	Input	<b>Clock enable:</b> Enables (registered HIGH) and disables (registered LOW) internal circuitry and clocks on the DRAM.
DMx	Input	<b>Data mask (x8 devices only):</b> DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH, along with that input data, during a write access. Although DM pins are input-only, DM loading is designed to match that of the DQ and DQS pins.
ODTx	Input	<b>On-die termination:</b> Enables (registered HIGH) and disables (registered LOW) termination resistance internal to the DDR3 SDRAM. When enabled in normal operation, ODT is only applied to the following pins: DQ, DQS, DQS#, DM, and CB. The ODT input will be ignored if disabled via the LOAD MODE command.
Par_In	Input	<b>Parity input:</b> Parity bit for Ax, RAS#, CAS#, and WE#.
RAS#, CAS#, WE#	Input	<b>Command inputs:</b> RAS#, CAS#, and WE# (along with S#) define the command being entered.
RESET#	Input (LVCMOS)	<b>Reset:</b> RESET# is an active LOW asynchronous input that is connected to each DRAM and the registering clock driver. After RESET# goes HIGH, the DRAM must be reinitialized as though a normal power-up was executed.
Sx#	Input	<b>Chip select:</b> Enables (registered LOW) and disables (registered HIGH) the command decoder.
SAx	Input	<b>Serial address inputs:</b> Used to configure the temperature sensor/SPD EEPROM address range on the I <sup>2</sup> C bus.
SCL	Input	<b>Serial clock for temperature sensor/SPD EEPROM:</b> Used to synchronize communication to and from the temperature sensor/SPD EEPROM on the I <sup>2</sup> C bus.
CBx	I/O	<b>Check bits:</b> Used for system error detection and correction.
DQx	I/O	<b>Data input/output:</b> Bidirectional data bus.
DQSx, DQSx#	I/O	<b>Data strobe:</b> Differential data strobes. Output with read data; edge-aligned with read data; input with write data; center-aligned with write data.

**Table 5: Pin Descriptions (Continued)**

Symbol	Type	Description
SDA	I/O	<b>Serial data:</b> Used to transfer addresses and data into and out of the temperature sensor/SPD EEPROM on the I <sup>2</sup> C bus.
TDQSx, TDQSx#	Output	<b>Redundant data strobe (x8 devices only):</b> TDQS is enabled/disabled via the LOAD MODE command to the extended mode register (EMR). When TDQS is enabled, DM is disabled and TDQS and TDQS# provide termination resistance; otherwise, TDQS# are no function.
Err_Out#	Output (open drain)	<b>Parity error output:</b> Parity error found on the command and address bus.
EVENT#	Output (open drain)	<b>Temperature event:</b> The EVENT# pin is asserted by the temperature sensor when critical temperature thresholds have been exceeded.
V <sub>DD</sub>	Supply	<b>Power supply:</b> 1.35V (1.283–1.45V) backward-compatible to 1.5V (1.425–1.575V). The component V <sub>DD</sub> and V <sub>DDQ</sub> are connected to the module V <sub>DD</sub> .
V <sub>DDSPD</sub>	Supply	<b>Temperature sensor/SPD EEPROM power supply:</b> 3.0–3.6V.
V <sub>REFCA</sub>	Supply	<b>Reference voltage:</b> Control, command, and address V <sub>DD</sub> /2.
V <sub>REFDQ</sub>	Supply	<b>Reference voltage:</b> DQ, DM V <sub>DD</sub> /2.
V <sub>SS</sub>	Supply	Ground.
V <sub>TT</sub>	Supply	<b>Termination voltage:</b> Used for control, command, and address V <sub>DD</sub> /2.
NC	–	<b>No connect:</b> These pins are not connected on the module.
NF	–	<b>No function:</b> These pins are connected within the module, but provide no functionality.

## DQ Map

## Functional Block Diagram

Figure 2: Functional Block Diagram

Note: 1. The ZQ ball on each DDR3 component is connected to an external  $240\Omega \pm 1\%$  resistor that is tied to ground. It is used for the calibration of the component's ODT and output driver.

## General Description

DDR3 SDRAM modules are high-speed, CMOS dynamic random access memory modules that use internally configured 8-bank DDR3 SDRAM devices. DDR3 SDRAM modules use DDR architecture to achieve high-speed operation. DDR3 architecture is essentially an  $8n$ -prefetch architecture with an interface designed to transfer two data words per clock cycle at the I/O pins. A single read or write access for the DDR3 SDRAM module effectively consists of a single  $8n$ -bit-wide, one-clock-cycle data transfer at the internal DRAM core and eight corresponding  $n$ -bit-wide, one-half-clock-cycle data transfers at the I/O pins.

DDR3 modules use two sets of differential signals: DQS, DQS# to capture data and CK and CK# to capture commands, addresses, and control signals. Differential clocks and data strobes ensure exceptional noise immunity for these signals and provide precise crossing points to capture input signals.

## Fly-By Topology

DDR3 modules use faster clock speeds than earlier DDR technologies, making signal quality more important than ever. For improved signal quality, the clock, control, command, and address buses have been routed in a fly-by topology, where each clock, control, command, and address pin on each DRAM is connected to a single trace and terminated (rather than a tree structure, where the termination is off the module near the connector). Inherent to fly-by topology, the timing skew between the clock and DQS signals can be easily accounted for by using the write-leveling feature of DDR3.

## Registering Clock Driver Operation

Registered DDR3 SDRAM modules use a registering clock driver device consisting of a register and a phase-lock loop (PLL). The device complies with the JEDEC standard "Definition of the SSTE32882 Registering Clock Driver with Parity and Quad Chip Selects for DDR3 RDIMM Applications."

The register section of the registering clock driver latches command and address input signals on the rising clock edge. The PLL section of the registering clock driver receives and redrives the differential clock signals (CK, CK#) to the DDR3 SDRAM devices. The register(s) and PLL reduce clock, control, command, and address signals loading by isolating DRAM from the system controller.

## Parity Operations

The registering clock driver includes an even parity function for checking parity. The memory controller accepts a parity bit at the Par\_In input and compares it with the data received on A[15:0], BA[2:0], RAS#, CAS#, and WE#. Valid parity is defined as an even number of ones (1s) across the address and command inputs (A[15:0], BA[2:0], RAS#, CAS#, and WE#) combined with Par\_In. Parity errors are flagged on Err\_Out#.

Address and command parity is checked during all DRAM operations and during control word WRITE operations to the registering clock driver. For SDRAM operations, the address is still propagated to the SDRAM even when there is a parity error. When writing to the internal control words of the registering clock driver, the write will be ignored if parity is not valid. For this reason, systems must connect the Par\_In pins on the DIMM and provide correct parity when writing to the registering clock driver control word configuration registers.

## **Temperature Sensor with Serial Presence-Detect EEPROM**

### **Thermal Sensor Operations**

The temperature from the integrated thermal sensor is monitored and converts into a digital word via the I<sup>2</sup>C bus. System designers can use the user-programmable registers to create a custom temperature-sensing solution based on system requirements. Programming and configuration details comply with JEDEC standard No. 21-C page 4.7-1, "Definition of the TSE2002av, Serial Presence Detect with Temperature Sensor."

### **Serial Presence-Detect EEPROM Operation**

DDR3 SDRAM modules incorporate serial presence-detect. The SPD data is stored in a 256-byte EEPROM. The first 128 bytes are programmed by Micron to comply with JEDEC standard JC-45, "Appendix X: Serial Presence Detect (SPD) for DDR3 SDRAM Modules." These bytes identify module-specific timing parameters, configuration information, and physical attributes. The remaining 128 bytes of storage are available for use by the customer. System READ/WRITE operations between the master (system logic) and the slave EEPROM device occur via a standard I<sup>2</sup>C bus using the DIMM's SCL (clock) SDA (data), and SA (address) pins. Write protect (WP) is connected to V<sub>SS</sub>, permanently disabling hardware write protection. For further information refer to Micron technical note TN-04-42, "Memory Module Serial Presence-Detect."

## Electrical Specifications

Stresses greater than those listed may cause permanent damage to the module. This is a stress rating only, and functional operation of the module at these or any other conditions outside those indicated in each device's data sheet is not implied. Exposure to absolute maximum rating conditions for extended periods may adversely affect reliability.

**Table 7: Absolute Maximum Ratings**

Symbol	Parameter	Min	Max	Units
$V_{DD}$	$V_{DD}$ supply voltage relative to $V_{SS}$	-0.4	1.975	V
$V_{IN}, V_{OUT}$	Voltage on any pin relative to $V_{SS}$	-0.4	1.975	V

**Table 8: Operating Conditions**

Symbol	Parameter	Min	Nom	Max	Units	Notes	
$V_{DD}$	$V_{DD}$ supply voltage	1.283	1.35	1.45	V		
		1.425	1.5	1.575	V	1	
$V_{REFCA(DC)}$	Input reference voltage command/address bus	$0.49 \times V_{DD}$	$0.5 \times V_{DD}$	$0.51 \times V_{DD}$	V		
$V_{REFDQ(DC)}$	I/O reference voltage DQ bus	$0.49 \times V_{DD}$	$0.5 \times V_{DD}$	$0.51 \times V_{DD}$	V		
$I_{VTT}$	Termination reference current from $V_{TT}$	-600	-	600	mA		
$V_{TT}$	Termination reference voltage (DC) – command/address bus	$0.49 \times V_{DD} - 20\text{mV}$	$0.5 \times V_{DD}$	$0.51 \times V_{DD} + 20\text{mV}$	V	2	
$I_I$	Input leakage current; Any input $0V \leq V_{IN} \leq V_{DD}$ ; $V_{REF}$ input $0V \leq V_{IN} \leq 0.95V$ (All other pins not under test = 0V)	Address inputs, RAS#, CAS#, WE#, BA	-	-	-	$\mu\text{A}$	3
		S#, CKE, ODT, CK, CK#	-	-	-		
		DM	-2	0	2		
$I_{OZ}$	Output leakage current; $0V \leq V_{OUT} \leq V_{DD}$ ; DQ and ODT are disabled; ODT is HIGH	-2	0	2	$\mu\text{A}$		
$I_{VREF}$	$V_{REF}$ supply leakage current; $V_{REFDQ} = V_{DD}/2$ or $V_{REFCA} = V_{DD}/2$ (All other pins not under test = 0V)	-9	0	9	$\mu\text{A}$		
$T_A$	Module ambient operating temperature	Commercial	0	-	70	$^{\circ}\text{C}$	4, 5
$T_C$	DDR3 SDRAM component case operating temperature	Commercial	0	-	95	$^{\circ}\text{C}$	4, 5, 6

- Notes:
1. Module is backward-compatible with 1.5V operation. Refer to device specification for details and operation guidance.
  2.  $V_{TT}$  termination voltage in excess of the stated limit will adversely affect the command and address signals' voltage margin and will reduce timing margins.

## 2GB (x72 SR) 240-Pin 1.35V DDR3L VLP RDIMM Electrical Specifications

---

3. Inputs are terminated to  $V_{DD}/2$ . Input current is dependent on terminating resistance selected in register.
4.  $T_A$  and  $T_C$  are simultaneous requirements.
5. For further information, refer to technical note TN-00-08: "Thermal Applications," available on Micron's Web site.
6. The refresh rate is required to double when  $85^{\circ}\text{C} < T_C \leq 95^{\circ}\text{C}$ .

## DRAM Operating Conditions

Recommended AC operating conditions are given in the DDR3 component data sheets. Component specifications are available on Micron's web site. Module speed grades correlate with component speed grades, as shown below.

**Table 9: Module and Component Speed Grades**

DDR3 components may exceed the listed module speed grades; module may not be available in all listed speed grades

Module Speed Grade	Component Speed Grade
-2G1	-093
-1G9	-107
-1G6	-125
-1G4	-15E
-1G1	-187E
-1G0	-187
-80C	-25E
-80B	-25

## Design Considerations

### Simulations

Micron memory modules are designed to optimize signal integrity through carefully designed terminations, controlled board impedances, routing topologies, trace length matching, and decoupling. However, good signal integrity starts at the system level. Micron encourages designers to simulate the signal characteristics of the system's memory bus to ensure adequate signal integrity of the entire memory system.

### Power

Operating voltages are specified at the DRAM, not at the edge connector of the module. Designers must account for any system voltage drops at anticipated power levels to ensure the required supply voltage is maintained.

## I<sub>DD</sub> Specifications

**Table 10: DDR3 I<sub>DD</sub> Specifications and Conditions – 2GB (Die Revision D)**

Values are for the MT41K256M8 DDR3L SDRAM only and are computed from values specified in the 1.35V 2Gb (256 Meg x 8) component data sheet

Parameter	Symbol	1333	1066	Units
Operating current 0: One bank ACTIVATE-to-PRE-CHARGE	I <sub>DD0</sub>	765	675	mA
Operating current 1: One bank ACTIVATE-to-READ-to-PRECHARGE	I <sub>DD1</sub>	900	855	mA
Precharge power-down current: Slow exit	I <sub>DD2P0</sub>	108	108	mA
Precharge power-down current: Fast exit	I <sub>DD2P1</sub>	270	225	mA
Precharge quiet standby current	I <sub>DD2Q</sub>	315	270	mA
Precharge standby current	I <sub>DD2N</sub>	333	288	mA
Precharge standby ODT current	I <sub>DD2NT</sub>	405	360	mA
Active power-down current	I <sub>DD3P</sub>	315	270	mA
Active standby current	I <sub>DD3N</sub>	360	315	mA
Burst read operating current	I <sub>DD4R</sub>	1440	1260	mA
Burst write operating current	I <sub>DD4W</sub>	1485	1305	mA
Refresh current	I <sub>DD5B</sub>	1800	1710	mA
Self refresh temperature current: MAX T <sub>C</sub> = 85°C	I <sub>DD6</sub>	108	108	mA
Self refresh temperature current (SRT-enabled): MAX T <sub>C</sub> = 95°C	I <sub>DD6ET</sub>	135	135	mA
All banks interleaved read current	I <sub>DD7</sub>	3465	3015	mA
Reset current	I <sub>DD8</sub>	126	126	mA

## 2GB (x72 SR) 240-Pin 1.35V DDR3L VLP RDIMM I<sub>DD</sub> Specifications

**Table 11: DDR3 I<sub>DD</sub> Specifications and Conditions – 2GB (Die Revision M)**

Values are for the MT41K256M8 DDR3L SDRAM only and are computed from values specified in the 1.35V 2Gb (256 Meg x 8) component data sheet

Parameter	Symbol	1600	1333	1066	Units
Operating current 0: One bank ACTIVATE-to-PRE-CHARGE	I <sub>DD0</sub>	540	495	450	mA
Operating current 1: One bank ACTIVATE-to-READ-to-PRECHARGE	I <sub>DD1</sub>	675	630	585	mA
Precharge power-down current: Slow exit	I <sub>DD2P0</sub>	108	108	108	mA
Precharge power-down current: Fast exit	I <sub>DD2P1</sub>	297	252	207	mA
Precharge quiet standby current	I <sub>DD2Q</sub>	297	252	207	mA
Precharge standby current	I <sub>DD2N</sub>	315	270	225	mA
Precharge standby ODT current	I <sub>DD2NT</sub>	360	315	270	mA
Active power-down current	I <sub>DD3P</sub>	423	378	333	mA
Active standby current	I <sub>DD3N</sub>	468	423	378	mA
Burst read operating current	I <sub>DD4R</sub>	1260	1125	990	mA
Burst write operating current	I <sub>DD4W</sub>	1125	990	855	mA
Refresh current	I <sub>DD5B</sub>	1710	1665	1620	mA
Self refresh temperature current: MAX T <sub>C</sub> = 85°C	I <sub>DD6</sub>	108	108	108	mA
Self refresh temperature current (SRT-enabled): MAX T <sub>C</sub> = 95°C	I <sub>DD6ET</sub>	135	135	135	mA
All banks interleaved read current	I <sub>DD7</sub>	1980	1845	1710	mA
Reset current	I <sub>DD8</sub>	126	126	126	mA

**Table 12: DDR3 I<sub>DD</sub> Specifications and Conditions – 2GB (Die Revision K)**

Values are for the MT41K256M8 DDR3L SDRAM only and are computed from values specified in the 1.35V 2Gb (256 Meg x 8) component data sheet

Parameter	Symbol	1600	1333	1066	Units
Operating current 0: One bank ACTIVATE-to-PRE-CHARGE	I <sub>DD0</sub>	351	342	324	mA
Operating current 1: One bank ACTIVATE-to-READ-to-PRECHARGE	I <sub>DD1</sub>	468	450	414	mA
Precharge power-down current: Slow exit	I <sub>DD2P0</sub>	108	108	108	mA
Precharge power-down current: Fast exit	I <sub>DD2P1</sub>	126	126	126	mA
Precharge quiet standby current	I <sub>DD2Q</sub>	180	180	180	mA
Precharge standby current	I <sub>DD2N</sub>	189	189	189	mA
Precharge standby ODT current	I <sub>DD2NT</sub>	279	261	234	mA
Active power-down current	I <sub>DD3P</sub>	189	189	189	mA
Active standby current	I <sub>DD3N</sub>	288	270	252	mA
Burst read operating current	I <sub>DD4R</sub>	846	738	612	mA
Burst write operating current	I <sub>DD4W</sub>	873	765	657	mA
Refresh current	I <sub>DD5B</sub>	1620	1611	1593	mA
Self refresh temperature current: MAX T <sub>C</sub> = 85°C	I <sub>DD6</sub>	108	108	108	mA
Self refresh temperature current (SRT-enabled): MAX T <sub>C</sub> = 95°C	I <sub>DD6ET</sub>	135	135	135	mA
All banks interleaved read current	I <sub>DD7</sub>	1404	1350	1089	mA
Reset current	I <sub>DD8</sub>	126	126	126	mA

## Registering Clock Driver Specifications

**Table 13: Registering Clock Driver Electrical Characteristics**

SSTE32882 devices or equivalent; Note 1 applies to entire table

Parameter	Symbol	Pins	Min	Nom	Max	Units	Notes
DC supply voltage	$V_{DD}$	–	1.283	1.35	1.45	V	
			1.425	1.5	1.575	V	2
DC reference voltage	$V_{REF}$	–	$0.49 \times V_{DD} - 20\text{mV}$	$0.5 \times V_{DD}$	$0.51 \times V_{DD} + 20\text{mV}$	V	
DC termination voltage	$V_{TT}$	–	$0.49 \times V_{DD} - 20\text{mV}$	$0.5 \times V_{DD}$	$0.51 \times V_{DD} + 20\text{mV}$	V	
AC high-level input voltage	$V_{IH(AC)}$	Control, command, address	$V_{REF} + 175\text{mV}$	–	$V_{DD} + 400\text{mV}$	V	
AC low-level input voltage	$V_{IL(AC)}$	Control, command, address	–0.4	–	$V_{REF} - 175\text{mV}$	V	
DC high-level input voltage	$V_{IH(DC)}$	Control, command, address	$V_{REF} + 100\text{mV}$	–	$V_{DD} + 0.4$	V	
DC low-level input voltage	$V_{IL(DC)}$	Control, command, address	–0.4	–	$V_{REF} - 100\text{mV}$	V	
High-level input voltage	$V_{IH(CMOS)}$	RESET#, MIRROR	$0.65 \times V_{DD}$	–	$V_{DD}$	V	
Low-level input voltage	$V_{IL(CMOS)}$	RESET#, MIRROR	0	–	$0.35 \times V_{DD}$	V	
Differential input crosspoint voltage range	$V_{IX(AC)}$	CK, CK#, FBIN, FBIN#	$0.5 \times V_{DD} - 175\text{mV}$	$0.5 \times V_{DD}$	$0.5 \times V_{DD} + 175\text{mV}$	V	
Differential input voltage	$V_{ID(AC)}$	CK, CK#	350	–	$V_{DD} + \text{TBD}$	mV	
High-level output current	$I_{OH}$	Err_Out#	–	–	TBD	mA	
Low-level output current	$I_{OL}$	Err_Out#	TBD	–	TBD	mA	

- Notes:
1. Timing and switching specifications for the register listed are critical for proper operation of the DDR3 SDRAM RDIMMs. These are meant to be a subset of the parameters for the specific device used on the module.
  2. The register is backward-compatible with 1.5V operation. Refer to device specification for details and operation guidance.

## Temperature Sensor with Serial Presence-Detect EEPROM

The temperature sensor continuously monitors the module's temperature and can be read back at any time over the I<sup>2</sup>C bus shared with the SPD EEPROM. Refer to JEDEC standard No. 21-C page 4.7-1, "Definition of the TSE2002av, Serial Presence Detect with Temperature Sensor."

### Serial Presence-Detect

For the latest SPD data, refer to Micron's SPD page: [www.micron.com/SPD](http://www.micron.com/SPD).

**Table 14: Temperature Sensor with SPD EEPROM Operating Conditions**

Parameter/Condition	Symbol	Min	Max	Units
Supply voltage	V <sub>DDSPD</sub>	3.0	3.6	V
Supply current: V <sub>DD</sub> = 3.3V	I <sub>DD</sub>	–	2.0	mA
Input high voltage: Logic 1; SCL, SDA	V <sub>IH</sub>	V <sub>DDSPD</sub> × 0.7	V <sub>DDSPD</sub> + 1	V
Input low voltage: Logic 0; SCL, SDA	V <sub>IL</sub>	–0.5	V <sub>DDSPD</sub> × 0.3	V
Output low voltage: I <sub>OUT</sub> = 2.1mA	V <sub>OL</sub>	–	0.4	V
Input current	I <sub>IN</sub>	–5.0	5.0	μA
Temperature sensing range	–	–40	125	°C
Temperature sensor accuracy (class B)	–	–1.0	1.0	°C

**Table 15: Temperature Sensor and SPD EEPROM Serial Interface Timing**

Parameter/Condition	Symbol	Min	Max	Units
Time bus must be free before a new transition can start	t <sub>BUF</sub>	4.7	–	μs
SDA fall time	t <sub>F</sub>	20	300	ns
SDA rise time	t <sub>R</sub>	–	1000	ns
Data hold time	t <sub>HD:DAT</sub>	200	900	ns
Start condition hold time	t <sub>H:STA</sub>	4.0	–	μs
Clock HIGH period	t <sub>HIGH</sub>	4.0	50	μs
Clock LOW period	t <sub>LOW</sub>	4.7	–	μs
SCL clock frequency	t <sub>SCL</sub>	10	100	kHz
Data setup time	t <sub>SU:DAT</sub>	250	–	ns
Start condition setup time	t <sub>SU:STA</sub>	4.7	–	μs
Stop condition setup time	t <sub>SU:STO</sub>	4.0	–	μs

## EVENT# Pin

The temperature sensor also adds the EVENT# pin (open-drain). Not used by the SPD EEPROM, EVENT# is a temperature sensor output used to flag critical events that can be set up in the sensor's configuration register.

EVENT# has three defined modes of operation: interrupt mode, compare mode, and critical temperature mode. Event thresholds are programmed in the 0x01 register using a hysteresis. The alarm window provides a comparison window, with upper and lower limits set in the alarm upper boundary register and the alarm lower boundary register, respectively. When the alarm window is enabled, EVENT# will trigger whenever the temperature is outside the MIN or MAX values set by the user.

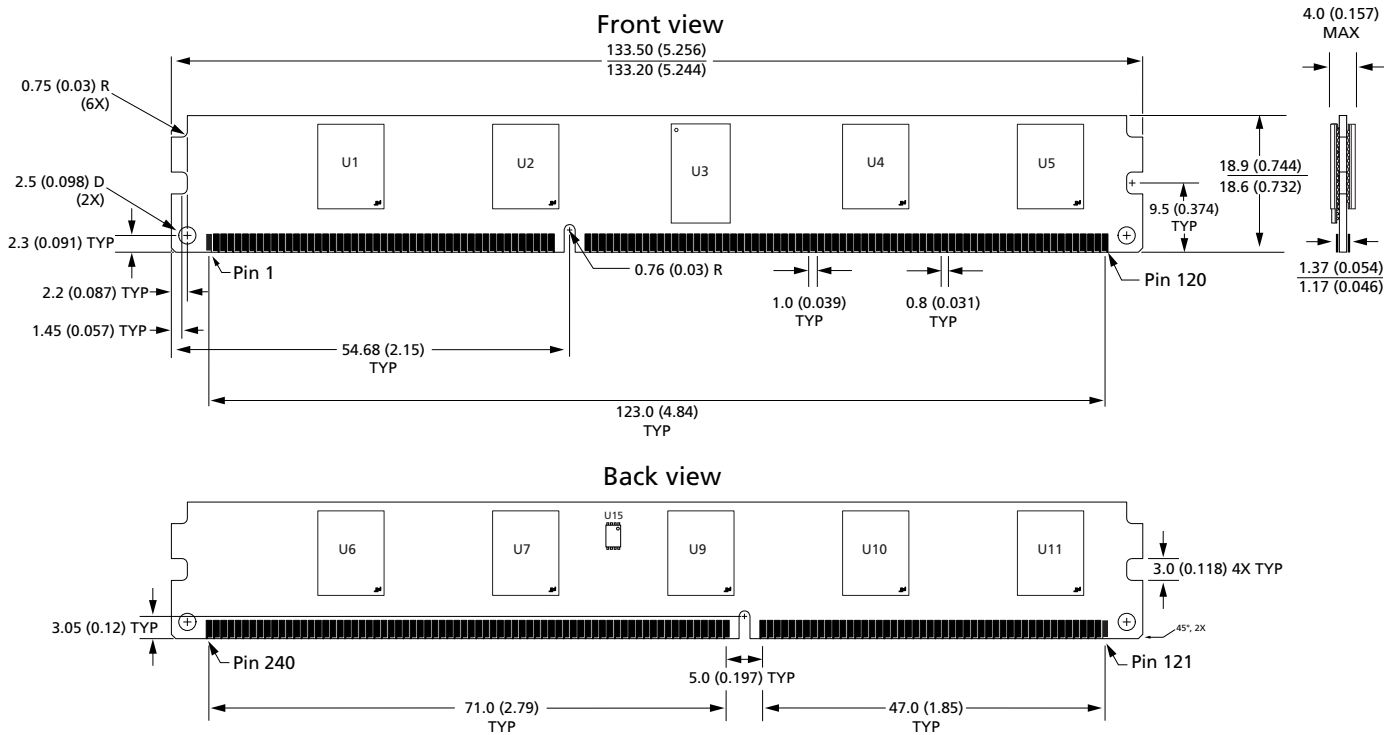

The interrupt mode enables software to reset EVENT# after a critical temperature threshold has been detected. Threshold points are set in the configuration register by the user. This mode triggers the critical temperature limit and both the MIN and MAX of the temperature window.

The compare mode is similar to the interrupt mode, except EVENT# cannot be reset by the user and returns to the logic HIGH state only when the temperature falls below the programmed thresholds.

Critical temperature mode triggers EVENT# only when the temperature has exceeded the programmed critical trip point. When the critical trip point has been reached, the temperature sensor goes into comparator mode, and the critical EVENT# cannot be cleared through software.

## Module Dimensions

**Figure 3: 240-Pin DDR3 RDIMM**

- Notes: 1. All dimensions are in millimeters (inches); MAX/MIN or typical (TYP) where noted.  
2. The dimensional diagram is for reference only.
