

RF Front-End Receiver Module

The AFRX5G372 is an integrated multi-chip module designed for TD-LTE and 5G mMIMO applications. It consists of a T/R switch, a two-stage low noise amplifier and support circuitry to work from a 5 V supply and a 1.8 V logic-level T/R control.

The device has Tx and Rx modes, which are controlled via T/R logic signaling. In Tx mode, internal RF switches direct the signal from the antenna port to an external termination resistor. In Rx mode, internal RF switches direct the signal from the antenna port to internal LNAs. While in Tx mode, the LNA is in idle mode with minimized current consumption.

FAILURE ANALYSIS

At this time, because of the physical characteristics of the part, failure analysis is limited to electrical signature analysis. In cases where NXP is contractually obligated to perform failure analysis (FA) services, full FA may be performed by third party vendors with moderate success. For updates contact your local NXP Sales Office.
