Stereo audio coder-decoder for MD, CD and MP3

## 1 FEATURES

### 1.1 General

- 2.4 to 3.6 V power supply
- 5 V tolerant digital inputs (at 2.7 to 3.6 V power supply)
- 24-bit data path for Analog-to-Digital Converter (ADC) and Digital-to-Analog Converter (DAC)
- Selectable control via L3-bus microcontroller interface or $\mathrm{I}^{2} \mathrm{C}$-bus interface; choice of 2 device addresses in L3-bus and $I^{2} \mathrm{C}$-bus mode

Remark: This device does not have a static mode.

- Supports sample frequencies from 8 to 55 kHz for the ADC part, and 8 to 100 kHz for the DAC part. The ADC does not support DVD audio ( 96 kHz audio), only Mini-Disc (MD), Compact-Disc (CD) and Moving Picture Experts Group Layer-3 Audio (MP3). For playback 8 to 100 kHz is specified. DVD playback is supported
- Power management unit:
- Separate power control for ADC, Automatic Volume Control (AVC), DAC, Phase Locked Loop (PLL) and headphone driver
- Analog blocks like ADC and Programmable Gain Amplifier (PGA) have a block to power-down the bias circuits
- When ADC and/or DAC are powered-down, the clocks to these blocks are also stopped to save power.
Remark: By default, when the IC is powered-up, the complete chip will be in the Power-down mode.
- ADC part and DAC part can run at different frequencies, either system clock or Word Select PLL (WSPLL)
- ADC and PGA plus integrated high-pass filter to cancel DC offset
- The decimation filter is equipped with a digital Automatic Gain Control (AGC)
- Mono microphone input with Low Noise Amplifier (LNA) of 29 dB fixed gain and Variable Gain Amplifier (VGA) from 0 to 30 dB in steps of 2 dB
- Integrated digital filter plus DAC
- Separate single-ended line output and one stereo headphone output, capable of driving a $16 \Omega$ load. The headphone driver has a built-in short-circuit protection with status bits which can be read out from the L3-bus or $\mathrm{I}^{2} \mathrm{C}$-bus interface
- Digital silence detection in the interpolator (playback) with read-out status via L3-bus or $\mathrm{I}^{2} \mathrm{C}$-bus interface
- Easy application.

### 1.2 Multiple format data input interface

- Slave BCK and WS signals
- ${ }^{2} \mathrm{~S}$-bus format
- MSB-justified format compatible
- LSB-justified format compatible.

### 1.3 Multiple format data output interface

- Select option for digital output interface: either the decimator output (ADC signal) or the output signal of the digital mixer which is in the interpolator DSP
- Selectable master or slave BCK and WS signals for digital ADC output

Remark: SYSCLK must be applied in WSPLL mode and master mode

- I2S-bus format
- MSB-justified format compatible
- LSB-justified format compatible.

### 1.4 ADC front-end features

- ADC plus decimator can run at either WSPLL, regenerating the clock from WSI signal, or on SYSCLK
- Stereo line input with PGA: gain range from 0 to 24 dB in steps of 3 dB
- LNA with 29 dB fixed gain for mono microphone input, including VGA with gain from 0 to 30 dB in steps of 2 dB
- Digital left and right independent volume control and mute from +24 to -63.5 dB in steps of 0.5 dB .

## Stereo audio coder-decoder for MD, CD and MP3

### 1.5 DAC features

- DAC plus interpolator can run at either WSPLL (regenerating the clock from WSI) or at SYSCLK
- Separate digital logarithmic volume control for left and right channels via L3-bus or $\mathrm{I}^{2} \mathrm{C}$-bus from 0 to -78 dB in steps of 0.25 dB
- Digital tone control, bass boost and treble via L3-bus or ${ }^{2}$ ²-bus interface
- Digital de-emphasis for sample frequencies of: $32,44.1,48$ and 96 kHz via L3-bus or $\mathrm{I}^{2} \mathrm{C}$-bus interface
- Cosine roll-off soft mute function
- Output signal polarity control via L3-bus or $I^{2} \mathrm{C}$-bus interface
- Digital mixer for mixing ADC output signal and digital serial input signal, if they run at the same sampling frequency.

## 2 APPLICATIONS

This audio coder-decoder is suitable for home and portable applications like MD, CD and MP3 players.

## 3 GENERAL DESCRIPTION

The UDA1380 is a stereo audio coder-decoder, available in TSSOP32 (UDA1380TT) and HVQFN32 (UDA1380HN) packages. All functions and features are identical for both package versions. The term 'UDA1380' in this document refers to both UDA1380TT and UDA1380HN, unless particularly specified.

The front-end of the UDA1380 is equipped with a stereo line input, which has a PGA control, and a mono microphone input with an LNA and a VGA. The digital decimation filter is equipped with an AGC which can be used in case of voice-recording.

The DAC part is equipped with a stereo line output and a headphone driver output. The headphone driver is capable of driving a $16 \Omega$ load. The headphone driver is also capable of driving a headphone without the need for external DC decoupling capacitors, since the headphone can be connected to a pin $\mathrm{V}_{\mathrm{REF}(\mathrm{HP})}$ on the chip.

In addition, there is a built-in short-circuit protection for the headphone driver output which, in case of short-circuit, limits the current through the operational amplifiers and signals the event via its L3-bus or $I^{2} \mathrm{C}$-bus register.

The UDA1380 also supports an application mode in which the coder-decoder itself is not running, but an analog signal, for instance coming from an FM tuner, can be controlled in gain and applied to the output via the headphone driver and line outputs.

The UDA1380 supports the $I^{2} \mathrm{~S}$-bus data format with word lengths of up to 24 bits, the MSB-justified data format with word lengths of up to 24 bits and the LSB-justified serial data format with word lengths of $16,18,20$ or 24 bits (LSB-justified 24 bits is only supported for the output interface).

The UDA1380 has sound processing features in playback mode, de-emphasis, volume, mute, bass boost and treble which can be controlled by the L3-bus or $I^{2} \mathrm{C}$-bus interface.

## Notes

1. When the supply voltages are below 2.7 V and the headphone load impedance is $16 \Omega$, it is recommended to limit the DAC and the headphone output to less than -2 dB ; otherwise clipping may occur.
2. The output voltage of the DAC is proportional to the DAC power supply voltage.
3. Channel separation performance is measured at the IC pin.

## Stereo audio coder-decoder for MD, CD and MP3

## 8 FUNCTIONAL DESCRIPTION

### 8.1 Clock modes

There are two clock systems:

- A SYSCLK signal, coming from the system
- A WSPLL which generates the internal clocks from the incoming WSI signal.

The system frequency applied to pin SYSCLK is selectable. The options are $256 \mathrm{f}_{\mathrm{s}}, 384 \mathrm{f}_{\mathrm{s}}, 512 \mathrm{f}_{\mathrm{s}}$ and $768 \mathrm{f}_{\mathrm{s}}$. The system clock must be locked in frequency to the digital interface signals.

Remark: Since there is neither a fixed reference clock available in the IC itself, nor a fixed clock available in the system the IC is in, there is no auto sample rate conversion detection circuitry

The system can run in several modes, using the two clock systems:

- Both the DAC and the ADC part can run at the applied SYSCLK input. In this case the WSPLL is powered-down
- The ADC can run at the SYSCLK input, and at the same time the DAC part can run (at a different frequency) at the clock re-generated from the WSI signal
- The ADC and the DAC can both run at the clock regenerated from the WSI signal.

### 8.1.1 WSPLL REQUIREMENTS

The WSPLL is meant to lock onto the WSI input signal, and regenerates $256 \mathrm{f}_{\mathrm{s}}$ and $128 \mathrm{f}_{\mathrm{s}}$ signals for the FSDAC and the interpolator core (and for the decimator if needed). Since the operating range of the WSPLL is from 75 to 150 MHz , the complete range of 8 to 100 kHz sampling frequency must be divided into smaller parts, as given in Table 1, using Fig. 4 as a reference. This means that the user must set the input range of the WSI input signal.

In case the SYSCLK is used for clocking the complete system (decimator including interpolator) the WSPLL must be powered-down with bit ADC_CLK via the L3-bus or $I^{2} \mathrm{C}$-bus

The SEL_LOOP_DIV[1:0] can be controlled by the PLL1 and PLLO bits in the L3-bus or $\mathrm{I}^{2} \mathrm{C}$-bus register.

Fig. 4 WSPLL set-up.

Table 1 WSPLL divider settings

| WORD SELECT <br> FREQUENCY (kHz) | SEL_LOOP_DIV[1:0] | PRE1 | DIV1 | VCO FREQUENCY <br> (MHz) |
| :--- | :---: | :---: | :---: | :---: |
| 6.25 to 12.5 | 00 | 8 | 1536 | 76 to 153 |
| 12.5 to 25 | 01 | 4 | 1536 |  |
| 25 to 50 | 10 | 2 | 1536 |  |
| 50 to 100 | 11 | 2 | 768 |  |

## Stereo audio coder-decoder <br> for MD, CD and MP3

UDA1380

### 8.1.2 CLOCK DISTRIBUTION

Figure 5 shows the main clock distribution for the SYSCLK domain and the WSPLL clock domain.
For power saving reasons each clock signal inside the system must be controlled and enabled via a separate bit in the L3-bus and $I^{2} \mathrm{C}$-bus registers (ADC_CLK).

The DAC part of the UDA1380 can operate from 8 to 100 kHz sampling frequency ( $\mathrm{f}_{\mathrm{s}}$ ). This applies to the DAC part only; the ADC part can run from 8 to 55 kHz .

Fig. 5 Clock routing for the main blocks inside the coder-decoder.

## Stereo audio coder-decoder for MD, CD and MP3

### 8.2 ADC analog front-end

The analog front-end of the UDA1380 consists of one stereo ADC with a selector in front of it (see Fig.6). Using this selector one can either select the microphone input with the microphone amplifier (LNA) with a fixed 29 dB gain and VGA (no PGA, since a real microphone amplifier is much better with respect to noise), or the line input which has a PGA for having 0 or 6 dB gain (for supporting 1 and 2 V (RMS) input). The PGA also provides gain control from 0 to 24 dB in steps of 3 dB .

## Remark:

- The input impedance of the PGA (line input) is $12 \mathrm{k} \Omega$, for the LNA this is $5 \mathrm{k} \Omega$

### 8.2.1 Applications and Power-down modes

The following Power-down modes and functional modes are supported:

- Power-down mode in which the power consumption is very low (only leakage currents)
In this mode there is no reference voltage at the line input
- Line input mode, in which the PGA can be used
- Microphone mode, in which the rest of the non-used PGAs and ADCs are powered-down
- Mixed PGA and LNA mode: one line input and one microphone input.

More information on the analog frond-end is given in Section 8.11.1.

Pin numbers for UDA1380HN in parentheses.
Fig. 6 Analog front-end.

### 8.2.2 LNA wITH VGA

The LNA is equipped with a VGA. The function of the VGA is to have additional variable analog gain from 0 to 30 dB in steps of 2 dB . This provides more flexibility in the choice of the microphone.

### 8.2.3 APPLICATIONS WITH 2 V (RMS) INPUT

For the line input it is preferable to have 0 dB and 6 dB gain settings in order to be able to apply both 1 and 2 V (RMS) input signals, using a series resistance. For this purpose a PGA is used which has 0 to 24 dB gain, in steps of 3 dB .

## Stereo audio coder-decoder for MD, CD and MP3

In applications in which a 2 V (RMS) input signal is used, a $12 \mathrm{k} \Omega$ resistor must be used in series with the input of the ADC (see Fig.7). This forms a voltage divider together with the internal ADC resistor and ensures that the voltage, applied to the input of the IC, never exceeds 1 V (RMS). Using this application for a 2 V (RMS) input signal, the switch must be set to 0 dB . When a 1 V (RMS) input signal is applied to the ADC in the same application, the gain switch must be set to 6 dB .

An overview of the maximum input voltages allowed against the presence of an external resistor and the setting of the gain switch is given in Table 2; the power supply voltage is assumed to be 3 V .

Table 2 Application modes using input gain stage

| RESISTOR <br> $(\mathbf{1 2 ~ k ~} \Omega \mathbf{)}$ | INPUT GAIN <br> SWITCH | MAXIMUM <br> INPUT <br> VOLTAGE |
| :--- | :---: | :---: |
|  | 0 dB | $2 \mathrm{~V}(\mathrm{RMS})$ |
|  | 6 dB | $1 \mathrm{~V}(\mathrm{RMS})$ |
| Absent | 0 dB | $1 \mathrm{~V}(\mathrm{RMS})$ |
|  | 6 dB | $0.5 \mathrm{~V}(\mathrm{RMS})$ |

### 8.3 Decimation filter (ADC)

The decimation from $128 f_{s}$ is performed in two stages. The
first stage realizes a $\frac{\sin x}{x}$ characteristic with a decimation
factor of 16 . The second stage consists of 3 half-band filters, each decimating by a factor 2 . The filter characteristics are shown in Table 3.

Table 3 Decimation filter characteristics

| ITEM | CONDITION $^{\text {Con }}$ | VALUE (dB) |
| :--- | :---: | :---: |
| Pass-band ripple | 0 to $0.45 f_{\mathrm{s}}$ | 0.01 |
| Stop band | $>0.55 \mathrm{f}_{\mathrm{s}}$ | -70 |
| Dynamic range | 0 to $0.45 \mathrm{f}_{\mathrm{s}}$ | $>135$ |
| Digital output <br> level | at 0 dB input <br> analog | -1.5 |

### 8.3.1 OVERLOAd DETECTION

The UDA1380 is equipped with an overload detector which can be read out from the L 3 -bus or $\mathrm{I}^{2} \mathrm{C}$-bus interface.

In practice the output is used to indicate whenever the output data, in either the output of the left or right channel, exceeds -1 dB (the actual figure is -1.16 dB ) of the maximum possible digital swing. When this condition is detected output bit OVERFLOW in the L3-bus register is forced to logic 1 for at least $512 f_{s}$ cycles ( 11.6 ms at $f_{s}=44.1 \mathrm{kHz}$ ). This time-out is reset for each infringement.

### 8.3.2 Volume control

The decimator is equipped with a digital volume control. This volume control is separate for left and right, and can be set with bits ML_DEC [7:0] and bits MR_DEC [7:0] via the L3-bus or $\mathrm{I}^{2} \mathrm{C}$-bus interface. The range is from +24 dB to -63.5 dB and mutes in steps of 0.5 dB .

### 8.3.3 Mute

The decimator is equipped with a dB-linear mute which mutes the signal in 256 steps of 0.5 dB .

### 8.3.4 AGC FUNCTION

The decimation filter is equipped with an AGC block. This function is intended, when enabled, to keep the output signal at a constant level. The AGC can be used for microphone applications in which the distance to the microphone is not always the same.

The AGC can be enabled via an L3-bus or $\mathrm{I}^{2} \mathrm{C}$-bus bit by setting the bit to logic 1 . In that case it bypasses the digital volume control.

Via the L3-bus or $\mathrm{I}^{2} \mathrm{C}$-bus interface also some other settings of the AGC, like the attack and decay settings and the target level settings, can be made.

Remark: The DC filter before the decimation filter must be enabled by setting the L3-bus or $I^{2}$ C-bus bit SKIP_DCFIL to logic 0 when AGC is in operation; otherwise the output will be disturbed by the DC offset added in the ADC.

# Stereo audio coder-decoder for MD, CD and MP3 

### 8.4 Interpolation filter (DAC)

The interpolation digital filter interpolates from 1 to $64 \mathrm{f}_{\mathrm{s}}$ or to $128 f_{\mathrm{s}}$, by cascading FIR filters, see Table 4 . The interpolator is equipped with several sound features like volume control, mute, de-emphasis and tone control.

Table 4 Interpolation filter characteristics

| ITEM | CONDITION | VALUE (dB) |
| :--- | :--- | :--- |
| Pass-band ripple | 0 to $0.45 f_{s}$ | $\pm 0.025$ |
| Stop band | $>0.55 f_{s}$ | -60 |
| Dynamic range | 0 to $0.45 f_{s}$ | $>135$ |

### 8.4.1 DIGITAL MUTE

Muting the DAC will result in a cosine roll-off soft mute, using $4 \times 32=128$ samples in normal mode (or 3 ms at 44.1 kHz sampling frequency). The cosine roll-off curve is illustrated in Fig.8. These cosine roll-off functions are implemented for both the digital mixer and the master mute inside the DAC data path, see Section 8.8.

Fig. 8 Mute as a function of raised cosine roll-off, displayed assuming 44.1 kHz .

### 8.4.2 Sound FEATURES

In addition, there are basic sound features:

- dB-linear volume control using 14-bit coefficients in steps of 0.25 dB : range 0 to -78 dB maximum suppression and $-\infty \mathrm{dB}$ : applies to both master volume and mixing volume control
- De-emphasis for 32, 44.1, 48 and 96 kHz for both channel 1 and 2 (selectable independently)
- Treble, which is selectable gain for high frequencies (positive gain only), the edge frequency of the treble is fixed (depends on the sampling frequency). Can be set for left and right independently:
- Two settings: $\mathrm{f}_{\mathrm{c}}=1.5 \mathrm{kHz}$ and $\mathrm{f}_{\mathrm{c}}=3 \mathrm{kHz}$, assuming sampling frequency is 44.1 kHz
- Both settings have 0 to 6 dB gain range in steps of 2 dB
- Bass boost, which is selectable gain for low frequencies (positive gain only). The edge frequency of the bass boost is fixed and depends on the sampling frequency. Can be set for left and right independently:
- Two settings: $f_{c}=250 \mathrm{~Hz}$ and $f_{c}=300 \mathrm{~Hz}$, assuming sampling frequency is 44.1 kHz
- First setting: 0 to 18 dB gain range in steps of 2 dB
- Second setting: 0 to 24 dB gain range in steps of 2 dB .

### 8.5 Noise shaper

The noise shaper consists of two mono 3rd-order noise shapers and one time-multiplexed stereo 5th-order noise shaper.

The order of the noise shaper can be chosen between 3 3rd-order (which runs at $128 f_{s}$ ) and 5th-order (which runs at $64 \mathrm{f}_{\mathrm{s}}$ ) via bit SEL_NS in the L3-bus or $\mathrm{I}^{2} \mathrm{C}$-bus register. The preferable choice for the noise shaper order is:

- 3rd-order noise shaper is preferred at low sampling frequencies, for instance between 8 and 32 kHz . This is for preventing out-of-band noise from the noise shaper to move into the audio band
- 5th-order noise shaper is normally used at higher sampling frequencies, normally from 32 to 100 kHz .

The noise shaper shifts in-band quantization noise to frequencies well above the audio band. This noise shaping technique enables high signal-to-noise ratios to be achieved. The noise shaper output is converted into an analog signal using an FSDAC

# Stereo audio coder-decoder for MD, CD and MP3 

### 8.6 FSDAC

### 8.6.1 General information

The Filter-Stream Digital-to-Analog Converter (FSDAC) is a semi-digital reconstruction filter that converts the 1-bit data stream (running at either $64 \mathrm{f}_{\mathrm{s}}$ for the 5th-order noise shaper or $128 \mathrm{f}_{\mathrm{s}}$ for the 3 rd-order noise shaper) of the noise shaper into an analog output voltage. The filter coefficients are implemented as current sources, and are summed at virtual ground of the output operational amplifier. In this way very high signal-to-noise performance and low clock jitter sensitivity are achieved. A post-filter is not needed due to the inherent filter function of the DAC. On-board amplifiers convert the FSDAC output current to an output voltage signal, capable of driving a line output. The output voltage of the FSDAC scales proportionally with the power supply voltage.

Remark: When the FSDAC is powered-down, the output of the FSDAC becomes high impedance.

### 8.6.2 ANALOG MIXER INPUT

The FSDAC has a mixer input, which makes it possible to mix an analog signal to the output signal of the FSDAC itself. In schematic form this is given in Fig.9.

This mixer input can be used for instance for mixing-in a GSM signal or an FM signal directly to the line output. In the UDA1380, the mixer input is connected from the ADC line input via an AVC unit.

Remark: Before the AVC unit can be used stand-alone, meaning without the digital part running, first the DAC part must be initialised in order to have the DAC output generating zero current. Otherwise the signal will be clipped.

Fig. 9 Mixing signals to the FSDAC output (analog domain).

### 8.7 Headphone driver

The UDA1380 is equipped with a headphone driver which can deliver 35 mW (at 3.0 V power supply) into a $16 \Omega$ load.

The headphone driver does not need external DC decoupling capacitors because it can be DC coupled with respect to a special headphone output reference voltage. This saves two external capacitors (which is quite useful in a portable device).

The headphone driver is equipped with short-circuit protection on all three operational amplifiers (left, right and the virtual ground). Each of the operational amplifiers has a signalling bit which becomes logic 1 in case the limiter is activated, for instance in case of a short-circuit. This means the microcontroller in the system can poll the L3-bus or $\mathrm{I}^{2} \mathrm{C}$-bus register of the headphone driver and as soon as (and for as long as) the short-circuit detection bits are activated, the microcontroller can signal the user that something is wrong or power-down the headphone driver (for instance, for energy-saving purposes).

Remark: To improve headphone channel separation performance, the distance between $\mathrm{V}_{\mathrm{REF}(\mathrm{HP})}$ and the micro speaker port must be minimized.

### 8.8 Digital and analog mixers (DAC)

### 8.8.1 DIGITAL MIXER

The ADC output signal and digital input signal can be mixed without external DSP as shown in Fig.10. This mixer can be controlled via the microcontroller interface, and must only be enabled when the ADC and the DAC are running at the same frequency. In addition, the mixer output signal can also be applied to the $I^{2} \mathrm{~S}$-bus output interface

## Stereo audio coder-decoder for MD, CD and MP3

Fig. 10 Digital mixer (DAC).

### 8.8.2 ANALOG MIXER

The analog mixer, which uses the mixer input of the FSDAC, can mix a signal into the FSDAC output signal via an AVC unit (see Fig.11). The mixer can be used to mix a signal into the FSDAC output signal and play it via the headphone driver without the complete coder-decoder running. The analog control range is 0 to -64.5 dB with a gain of 16.5 dB , and mutes in steps of 1.5 dB (so actually the range is from +16.5 dB to -48 dB plus mute).

Fig.11 Analog mixer configuration.

## Stereo audio coder-decoder for MD, CD and MP3

### 8.9 Application modes

The operation mode can be set with pin SEL_L3_IIC, either to L3-bus mode (LOW) or to the $\mathrm{I}^{2} \mathrm{C}$-bus mode (HIGH) as given in Table 5.

For all features in microcontroller mode see Chapter 9.
Table 5 Pin function in the selected mode

| PIN | L3-BUS MODE <br> SEL_L3_IIC $=$ L | $\mathbf{I}^{2} \mathbf{C}$-BUS MODE <br> SEL_L3_IIC $=\mathbf{H}$ |
| :--- | :---: | :---: |
| L3CLOCK/SCL | L3CLOCK | SCL |
| L3MODE | L3MODE | A1 |
| L3DATA/SDA | L3DATA | SDA |

Remark: In the $\mathrm{I}^{2} \mathrm{C}$-bus mode there is a bit A 1 which sets the LSB bit of the address of the UDA1380. In L3-bus mode this bit is not available, meaning the device has only one L3-bus device address.

### 8.10 Power-on reset

The UDA1380 has a dedicated reset pin, which has a pull-down resistor. This way a Power-on reset circuit can be made with a capacitor and a resistor at the pin. The internal pull-down resistor cannot be used because of the 5 V tolerant nature of the pad. The pull-down resistor is shielded from the outside world by a transmission gate in order to support 5 V tolerance.

The reset timing is determined by the external capacitor and resistor which are connected to pin RESET, and the internal pull-down resistor. On Power-on reset, all the digital sound processing features and the system controlling features are set to the default setting of the L3-bus and $\mathrm{I}^{2} \mathrm{C}$-bus control modes.

Remark: The reset time should be at least $1 \mu \mathrm{~s}$, and during the reset time the system clock should be running. In case the WSPLL is selected as the clock source, a clock must be connected to the SYSCLK input in order to have a proper reset of the L3-bus or $I^{2} \mathrm{C}$-bus registers. This is because the clock source is set to SYSCLK by default.

### 8.11 Power-down requirements

The following blocks have power-down control via the L3-bus or $I^{2} \mathrm{C}$-bus interface:

- Microphone amplifier (LNA) including its Single-Ended to Differential Converter (SDC) and VGA
- ADC plus SDC and the PGA, for left and right separate
- Bias generation circuit for the front-end and the FSDAC
- Headphone driver
- WSPLL
- FSDAC.

Clocks of the decimator, interpolator and the analog blocks have separate enable and disable controls.

## Stereo audio coder-decoder for MD, CD and MP3

### 8.11.1 ANALOG FRONT-END

Figure 12 shows the power control inside the analog front-end. The control of all power-on pins of the ADC front-end is done via separate L 3 -bus or $\mathrm{I}^{2} \mathrm{C}$-bus bits.

### 8.11.2 FSDAC POWER CONTROL

The FSDAC block has power-on pins: one of which shuts down the DAC itself, but leaves the output still at $\mathrm{V}_{\text {REF }}$ voltage (which is half the power supply). This function is set by the bit PON_DAC in the L3-bus or $I^{2} \mathrm{C}$-bus register.

A second L3-bus or $\mathrm{I}^{2} \mathrm{C}$-bus bit shuts down the complete bias circuit of the FSDAC, via bit PON_BIAS in the L3-bus or $\mathrm{I}^{2} \mathrm{C}$-bus register. This bit PON_BIAS acts the same as given in Fig. 12 for the analog front-end.

### 8.12 Plop prevention

Plops are ticks and other strange sounds that can occur when a part of a device is powered-up or powered-down, or when switching between modes is done.

Some ways to prevent plops from occurring are:

- When the FSDAC or headphone driver must be powered-down, first a digital mute is applied. After that
the FSDAC or headphone driver can be powered-down. In case the FSDAC or headphone driver must be powered-up, first the analog part is switched on, then the digital part is demuted
- When the ADC must be powered-down, a digital mute sequence must be applied. When the digital output signal is completely muted, the ADC can be powered-down. In case the ADC must be powered-up, first the analog part must be powered-up, then the digital part must be demuted
- When there is a change of, for example, clock divider settings or clock source (selecting between SYSCLK and WSPLL clock), then also digital mute for that block (either decimator or interpolator) should be used.

Remark: All items mentioned in Section 8.12 are not 'hard-wired' implemented, but are to be followed by the user as a guideline for plop prevention.

## Stereo audio coder-decoder for MD, CD and MP3

### 8.13 Digital audio data input and output

The supported audio formats for the control modes are:

- ${ }^{2}$ S-bus
- MSB-justified
- LSB-justified, 16 bits
- LSB-justified, 18 bits
- LSB-justified, 20 bits
- LSB-justified, 24 bits (only for the output interface).

The bit clock BCK can be up to $128 f_{\mathrm{s}}$, or in other words the BCK frequency is 128 times the WS frequency or less: $\mathrm{f}_{\mathrm{BCK}} \leq 128 \mathrm{f}_{\mathrm{ws}}$.

Remark: The WS edge must coincide with the negative edge of the BCK at all times, for proper operation of the digital I/O data interface. Figure 13 shows the interface signals.

### 8.13.1 Digital audio input interface

The digital audio input interface is slave only, meaning the system must provide the WSI and BCKI signals (next to the DATAI signal).

Either the WSPLL locks onto the WSI signal and provides the internal clocks for the interpolator and the FSDAC, or a system clock must be applied which must be in frequency lock to the digital data input interface signals.

### 8.13.2 DIGITAL AUDIO OUTPUT INTERFACE

The digital audio output interface can be either master or slave. The data source for the data output can be selected from either the decimator (ADC front-end) or the digital mixer output.

Remark: The digital mixer output is only valid if both the decimator and the interpolator run at the same clock:

- In slave mode the signals on pins BCKO, WSO and SYSCLK must be applied from the application (signals must be in frequency lock) and the UDA1380 returns the DATAO signal from the decimator. The applied signal from pin BCKO can be for instance: $32 \mathrm{f}_{\mathrm{s}}, 48 \mathrm{f}_{\mathrm{s}}, 64 \mathrm{f}_{\mathrm{s}}$, $96 f_{s}$ or $128 f_{s}$
- In master mode the SYSCLK signal must be applied from the system, then the UDA1380 returns with the BCKO, WSO and the DATAO signals. For the BCKO clock, there are 2 general rules:
- When the SYSCLK is either $256 \mathrm{f}_{\mathrm{s}}$ or $512 \mathrm{f}_{\mathrm{s}}$, the BCKO frequency is $64 \mathrm{f}_{\mathrm{s}}$
- When the SYSCLK is either $384 \mathrm{f}_{\mathrm{s}}$ or $768 \mathrm{f}_{\mathrm{s}}$, the BCKO signal is $48 \mathrm{f}_{\mathrm{s}}$.

The slave and master modes can be selected by the bit Serial Interface Mode (SIM) in the L3-bus or $\mathrm{I}^{2} \mathrm{C}$-bus interface

## 9 L3-BUS INTERFACE DESCRIPTION

The UDA1380 has an L3-bus microcontroller interface mode. Controllable system and digital sound processing features are:

- Software reset
- System clock frequency (selection between $256 \mathrm{f}_{\mathrm{s}}, 384 \mathrm{f}_{\mathrm{s}}$, $512 \mathrm{f}_{\mathrm{s}}$ and $768 \mathrm{f}_{\mathrm{s}}$ clock divider settings)
- Clock mode setting, for instance, which block runs at which clock, and clock enabling
- Power control for the WSPLL
- Data input and data output format control, for input and output independently including data source selection for the digital output interface
- ADC features:
- Digital mute
- AGC enable and settings
- Polarity control
- Input line amplifier control ( 0 to 24 dB in steps of 3 dB )
- DC filtering control
- Digital gain control (+24 to -63 dB gain in steps of 0.5 dB ) for left and right
- Power control
- VGA of the microphone input
- Selection of line or microphone input.
- DAC and headphone driver features:
- Power control FSDAC and headphone driver
- Polarity control
- Mixing control (only available when both decimator and interpolator run at the same speed). This includes the mixer volumes, mute and mixer position switch
- De-emphasis control
- Master volume and balance control
- Flat/minimum/maximum settings for bass boost and treble
- Tone control: bass boost and treble
- Master mute control
- Headphone driver short-circuit protection status bits.

# Stereo audio coder-decoder for MD, CD and MP3 

### 9.1 Introduction

The exchange of data and control information between the microcontroller and the UDA1380, is accomplished through a serial hardware interface comprising the following pins:

L3DATA/SDA: microcontroller interface data line L3MODE: microcontroller interface mode line L3CLOCK/SCL: microcontroller interface clock line.

Information transfer via the microcontroller bus is organized LSB first, and in accordance with the so called 'L3' format, in which two different modes of operation can be distinguished: address mode and data transfer mode.

Inside the microcontroller interface there is a hand-shake mechanism which takes care of proper data transfer from the microcontroller interface clock to the destination clock domains. This means that when data is sent to the microcontroller interface, the system clock must be running.

### 9.2 Device addressing

The device addressing mode is used to select a device for subsequent data transfer. The address mode is characterized by the signal on pin L3MODE being LOW and a burst of 8 pulses on pin L3CLOCK/SCL, accompanied by an 8 bit device address on pin L3DATA/SDA. The fundamental timing is shown in Figs 14 and 15.

Table 6 Selection of data transfer

| DOM <br> BIT 1 | DOM <br> BIT 0 | TRANSFER |
| :---: | :---: | :--- |
| 0 | 0 | not used |
| 0 | 1 | not used |
| 1 | 0 | DATA and STATUS write or pre-read |
| 1 | 1 | DATA and STATUS read |

Table 6 shows that there are two types of data transfers: DATA and STATUS which can be read and written Table 6 also shows that the DATA and STATUS read and write actions are combined.

The device address consists of one byte, which is split-up in two parts:

- Bits 7 to 2 represent a 6-bit device address. In the UDA1380 this is 000001
- Bits 1 to 0 called Data Operation Mode, or DOM bits, represent the type of data transfer according to Table 6.

### 9.3 Slave address

The UDA1380 acts as a slave receiver or a slave transmitter. Therefore the signals L3CLOCK and L3MODE are only input signals. The data signal L3DATA is a bidirectional line. The UDA1380 slave address is shown in Table 7.

Table 7 L3 slave address

| (MSB) | BIT | (LSB) |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 0 | 1 |

### 9.4 Register addressing

After sending the device address, including the flags (the DOM bits) whether information is read or written, one byte is sent with the destination register address using 7 bits, and one bit which signals whether information will be read or written. The fundamental timing for L3 is given in Fig.19.

Basically there are three forms for register addressing:

- Register addressing for L3 write: the first bit is a logic 0 indicating a write action to the destination register, followed by seven register address bits
- Prepare read addressing: the first bit of the byte is logic 1; signalling data will be read from the register indicated
- The read action itself: in this case the device returns a register address prior to sending data from that register. When the first bit of the byte is logic 0 , the register address was valid, in case the first bit is a logic 1 the register address was invalid.

## Remarks:

- Each time a new destination address needs to be written, the device address must be sent again
- When addressing the device for the first time after power-up of the device, at least one L3 clock-cycle must be given to enable the L3 interface.

## Stereo audio coder-decoder for MD, CD and MP3

### 9.5 Data write mode

For writing data to a device, four bytes must be sent. Figure 14 explains the data write mode in a signal diagram:

- One byte with the device address, being '00000110', which is including the LSB code 01 for signalling write to the device
- One byte starting with a logic 0 for signalling write, followed by 7 bits indicating the destination address
- Two data bytes.

The SYSCLK signal must be applied in data write mode.
Table 8 L3 write data

| L3 MODE | DATA TYPE | BIT |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $0^{(1)}$ | 1 | 2 | 3 | 4 | 5 | 6 | $7{ }^{(2)}$ |
| Addressing mode | device address | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |
| Data transfer 1 | register address | 0 | A6 | A5 | A4 | A3 | A2 | A1 | A0 |
| Data transfer 2 | MS data byte | D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 |
| Data transfer 3 | LS data byte | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |

## Notes

1. First bit in time.
2. Last bit in time.

### 9.6 Data read mode

For reading from the device, first a prepare-read must be done. After this, the device address is sent again. The device then returns with the register address, indicating whether the address was valid or not, and the data of the register. The following five steps explain this procedure, and an example of transmission is given in Fig. 15.

- One byte with the device address, being '00000110', which is including the LSB code 01 for signalling write to the device
- One byte is sent with the register address from which it needs to be read. This byte starts with a logic 1, which indicates that there will be a read action from the register
- One byte with the device address including ' 11 ' is sent to the device, being 00000111. The ' 11 ' indicates that the device must write data to the microcontroller, then the microcontroller frees the L3DATA-bus so the UDA1380 can send the register address byte and its two-byte contents
- The device now writes the requested register address on the bus, indicating whether the requested register was valid or not (logic 0 means valid, logic 1 means invalid)
- The device writes the data from the requested register on the bus, being two bytes.

The SYSCLK signal must be applied in data read mode.

## Stereo audio coder-decoder for MD, CD and MP3

Table 9 L3 prepare read data

| L3 MODE | DATA TYPE | BIT |  |  |  |  |  |  |  |

Stereo audio coder-decoder
for MD, CD and MP3

## Stereo audio coder-decoder for MD, CD and MP3

## 10 I²$^{2}$ C-BUS INTERFACE DESCRIPTION

The UDA1380 supports ${ }^{2} \mathrm{C}$-bus microcontroller interface mode as well as the L3-bus mode; all features can be controlled by the microcontroller with the same register addresses as in the L3-bus mode.

The exchange of data and control information between the microcontroller and the UDA1380 in $I^{2} \mathrm{C}$-bus mode is accomplished through a serial hardware interface comprising the following pins:

L3CLOCK/SCL: microcontroller interface clock line, SCL
L3MODE: sets the bit A 1 of the $I^{2} \mathrm{C}$-bus device address
L3DATA/SDA: microcontroller interface data line, SDA.
Figure 20 shows the clock and data timing of the $\mathrm{I}^{2} \mathrm{C}$-bus transfer.

### 10.1 Addressing

Before any data is transmitted on the $\mathrm{I}^{2} \mathrm{C}$-bus, the device which should respond is addressed first. The addressing is always done with the first byte transmitted after the start procedure. The UDA1380 device address is [A6 to A0] 00110(A1)0, with bit A1 as the address selection bit (two addresses possible).

### 10.1.1 DEVICE ADDRESS (PIN A1)

The UDA1380 acts as either a slave receiver or a slave transmitter. Therefore the clock signal SCL is only an input signal. The data signal SDA is a bidirectional line. Table 11 shows the device address of the UDA1380.

The device can be set to one of the two addresses by using bit A1 (which is pin L3MODE) to select.

Table $11 I^{2} \mathrm{C}$-bus device address

| (MSB) | BIT |  |  |  |  |  |  |  | (LSB) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 1 | 1 | 0 | A 1 | 0 | $\mathrm{R} / \overline{\mathrm{W}}$ |  |  |

### 10.1.2 Register address

Table 12 shows the register address format of the UDA1380. The register mapping in $I^{2} \mathrm{C}$-bus mode is the same as for the L3-bus interface.

Table $12{ }^{1}{ }^{2} \mathrm{C}$-bus register address

| (MSB) | BIT |  |  |  |  | (LSB) |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | A6 | A5 | A4 | A3 | A2 | A1 | A0 |  |

Stereo audio coder-decoder
for MD, CD and MP3
10.2 WRITE cycle
Table 13 shows the $I^{2} \mathrm{C}$-bus configuration for a WRITE cycle. The WRITE cycle is used to write the data to the internal registers. The device and register addresses are one byte each, the setting data is always a pair of two bytes.
The format of the WRITE cycle is as follows:

1. The microcontroller begins by asserting a start condition (S).
2. The first byte ( 8 bits) contains the device address ' $00110 A_{1} 0$ ' and the $R / \bar{W}$ bit is set to logic 0 (WRITE).
3. The UDA1380 asserts an acknowledge (A).
4. The microcontroller writes the 8 -bit address (ADDR) of the UDA1380 register to which the data will be written.
5. The UDA1380 acknowledges this register address (A).
6. The microcontroller sends two bytes of data with the Most Significant (MS) byte first, followed by the Least Significant (LS) byte; after each byte the UDA1380 asserts an acknowledge (A).
7. After each pair of bytes transmitted, the register address is auto-incremented; after each byte the UDA1380 asserts an acknowledge (A).
8. The UDA1380 frees the $I^{2} \mathrm{C}$-bus allowing the microcontroller to generate a stop condition ( P ).
Table 13 Master transmitter writes to UDA1380 registers in the $\mathrm{I}^{2} \mathrm{C}$-bus mode

Stereo audio coder-decoder
10.3 READ cycle
Table 14 shows the $I^{2} \mathrm{C}$-bus configuration for a READ cycle. The READ cycle is used to read the data values from the internal registers. The format of the READ cycle is as follows:

1. The microcontroller begins by asserting a start condition ( S ).
2. The first byte ( 8 bits) contains the device address ' $00110 A_{1} 0$ ' and the $R / \bar{W}$ bit is set to logic 0 (WRITE).
3. The UDA1380 asserts an acknowledge (A).
4. The microcontroller writes the 8-bit address (ADDR) of the UDA1380 register from which the data will be read.
5. The UDA1380 acknowledges this register address (A).
6. The microcontroller generates a repeated start ( Sr )
7. The microcontroller generates the device address ' $00110 \mathrm{~A}_{1} 0$ ' again, but this time the R/W bit is set to logic 1 (READ).
8. The UDA1380 asserts an acknowledge (A).
9. The UDA1380 sends two bytes of data with the Most Significant (MS) byte first, followed by the Least Significant (LS) byte; after each byte the microcontroller asserts an acknowledge (A).
10. After each pair of bytes transmitted, the register address is auto-incremented; after each byte the microcontroller asserts an acknowledge (A). 11. The microcontroller stops this cycle by generating a negative acknowledge (NA).
11. The UDA1380 frees the I2C-bus allowing the microcontroller to generate a stop condition ( P ).
Table 14 Master transmitter reads from the UDA1380 registers in the $\mathrm{I}^{2} \mathrm{C}$-bus mode

| Default | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

Table 18 Description of register bits

| BIT | SYMBOL | DESCRIPTION |
| :---: | :--- | :--- |
| 15 to 13 | EV[2:0] | Evaluation bits. Bits EV2, EV1 and EV0 are special control bits for <br> manufacturer's evaluation and must always be kept at their default values for <br> normal operation of UDA1380; default value 000. |
| 12 | - | default value 0 |
| 11 | EN_ADC | ADC clock enable. A 1-bit value to enable the system clock (from SYSCLK <br> input) to the analog part of the ADC. See Fig.5 for more detailed information. <br> When this bit is logic 0: clock to ADC disabled and when this bit is logic 1: <br> clock to ADC running. Default value 0. |
| 10 | EN_DEC | Decimator clock enable. A 1-bit value to enable the 128f <br> s clock to the <br> decimator, the 128f |
| L3-bust of the I2S-bus output block and the clock to the ADC |  |  |
| L3-bus registers. See Fig.5 for more detailed information. When |  |  |
| this bit is logic 0: clock to the decimator disabled. When this bit is logic $1:$ |  |  |
| clock to the decimator running. Default value 1. |  |  |

Stereo audio coder-decoder
for MD, CD and MP3

| BIT | SYMBOL | DESCRIPTION |
| :---: | :---: | :---: |
| 4 | DAC_CLK | DAC clock select. A 1-bit value to select the clocks for the DAC (interpolator and FSDAC analog block). In both cases the clocks must be $128 \mathrm{f}_{\mathrm{s}}$ and $256 \mathrm{f}_{\mathrm{s}}$ (for the analog part), but in one case the clock is derived from the WSI clock, and in the other case the clock is derived from the SYSCLK. When this bit is logic 0 : SYSCLK is used. When this bit is logic 1 : WSPLL is used. Default value 0 . |
| 3 and 2 | sys_div[1:0] | Dividers for system clock input. A 2-bit value to select the proper division factor for the SYSCLK input in such a way that a128f ${ }_{s}$ clock will be generated from the SYSCLK clock signal. The $128 f_{s}$ clock is needed for clocking the decimator and interpolator. Default value 00, see Table 19. |
| 1 and 0 | PLL[1:0] | WSPLL setting. A 2-bit value to select the WSPLL input frequency range. These set the proper divider setting for the WSPLL. The input is the WSI signal, the output inside the IC is a $128 \mathrm{f}_{\mathrm{s}}$ and a $256 \mathrm{f}_{\mathrm{s}}$ clock. Default value 10, see Table 20. |

Table 19 Dividers for system clock input

| sys_div1 | sys_div0 | INPUT CLOCK ON PIN SYSCLK |
| :---: | :---: | :---: |
| 0 | 0 | $256 \mathrm{f}_{\mathrm{s}}$ (default) |
| 0 | 1 | $384 \mathrm{f}_{\mathrm{s}}$ |
| 1 | 0 | $512 \mathrm{f}_{\mathrm{s}}$ |
| 1 | 1 | $768 \mathrm{f}_{\mathrm{s}}$ |

### 11.3 Power control settings

### 11.3.1 POWER CONTROL SETTING BIAS CIRCUITS

Using a 1-bit value, the power control settings of the bias circuits of the ADC, AVC and FSDAC can be set. When this bit is set to logic 0 , the complete bias circuits of the analog front-end and the FSDAC are shut down. In this case, the reference voltage disappears from the input of the ADCs and LNA and the output of the FSDAC, this can cause plops but saves power.

Table 25 Register address 02H

### 11.5 Headphone amplifier settings

Using a 1-bit value, it is possible to disable the short-circuit protection of the headphone amplifier. This function is provided to offer maximum freedom to users, however due to the nature of this function there is the drawback of possible damage. Bits RSV12, RSV11, RSV10, RSV02, RSV01, and RSV00 are special control bits for manufacturer's evaluation and must always be kept at their default values for normal operation of UDA1380.

Table 30 Register address 04H

Table 39 Description of register bits

| BIT | SYMBOL | DESCRIPTION |
| :---: | :--- | :--- |
| 15 and 14 | M[1:0] | Flat/minimum/maximum setting. A 2-bit value to program the mode of the sound <br> processing filters of bass boost and treble. Default value 00, see Table 40. |
| 13 and 12 | TRL[1:0] | Treble setting left. A 2-bit value to program the mode of the sound processing filter of <br> treble. The used setting depends on the bits M1 and M0. Default value 00, see Table 41. |
| 11 to 8 | BBL[3:0] | Bass boost setting left. A 4-bit value to program the bass boost setting, which can be set <br> for left and right independently. The used set depends on the bits M1 and M0. Default <br> value 0000, see Table 42. |
| 7 and 6 | - | default value 00 |
| 5 and 4 | TRR[1:0] | Treble setting right. A 2-bit value to program the mode of the sound processing filter of <br> treble. Default value 00, see Table 41. |
| 3 to 0 | BBR[3:0] | Bass boost setting right. A 4-bit value to program the bass boost setting, which can be <br> set for left and right independently. The used set depends on the mode bits. Default <br> value 0000, see Table 42. |

| Default | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 44 Description of register bits

| BIT | SYMBOL | DESCRIPTION |
| :---: | :--- | :--- |
| 15 | - | default value 0 |
| 14 | MTM | Master mute. A 1-bit value to enable the digital mute for the master. When <br> this bit is logic 0: no soft mute of master. When this bit is logic 1: soft mute of <br> master. Default value 1. |
| 13 and 12 | - | default value 00 |
| 11 | MT2 | Channel 2 mute. A 1-bit value to enable the digital mute for channel 2. After <br> enabling the mixer, bit MT2 must be set to logic 0. When this bit is logic 0: no <br> soft mute of channel 2. When this bit is logic 1: soft mute of channel 2. Default <br> value 1 (meaning that channel 2 is always muted, even when the mixer is <br> enabled). |
| 70 to 8 | DE2_[2:0] | - |
| 3 | MT1 | De-emphasis. A 3-bit value to enable the digital de-emphasis filter for <br> channel 2. Default value 000, see Table 45. |
| 2 to 0 | DE1_[2:0] | default value 0000 |
| Channel 1 mute. A 1-bit value to enable the digital mute for channel 1. When |  |  |
| this bit is logic 0: no soft mute of channel 1. When this bit is logic 1: soft mute |  |  |
| of channel 1. Default value 0. |  |  |

Table 45 De-emphasis selection bits

### 11.10 Mixer, silence detector and oversampling settings

Table 46 Register address 14H

| BIT | $\mathbf{1 5}$ | $\mathbf{1 4}$ | $\mathbf{1 3}$ | $\mathbf{1 2}$ | $\mathbf{1 1}$ | $\mathbf{1 0}$ | $\mathbf{9}$ | $\mathbf{8}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Symbol | DA_POL_INV | SEL_NS | MIX_POS | MIX | - | - | - | - |
| Default | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| BIT | $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Symbol | SILENCE | SDET_ON | SD_VALUE1 | SD_VALUE0 | - | - | OS1 | OS0 |
| Default | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 47 Description of register bits

| BIT | SYMBOL | DESCRIPTION |
| :---: | :---: | :---: |
| 15 | DA_POL_INV | DAC polarity control. A 1-bit value to control the signal polarity of the DAC output signal. When this bit is logic 0: DAC output not inverted. When this bit is logic 1: DAC output inverted. Default value 0. |
| 14 | SEL_NS | Noise shaper order select. A 1-bit value to select between the $3 r d$-order and the 5th-order noise shaper. When this bit is logic 0 : select $3 r d-$ order noise shaper. When this bit is logic 1: select 5th-order noise shaper. Default value 0. |
| 13 | MIX_POS | Mixer signal control. A 2-bit value to select the digital mixer settings inside the interpolation filter. Default value 0. By default the mixer is off, see Table 48. |
| 12 | MIX |  |
| 11 to 8 | - | default value 0000 |
| 7 | SILENCE | Silence mode. A 1-bit value to force the DAC output to silence. When this bit is logic 0 : no overruling. The setting of the FSDAC silence switch depends on the status of the digital silence detector circuit and the master_mute status. When this bit is logic 1: overruling. The FSDAC silence switch is activated, independent of the status of the digital silence detector circuit or the master_mute status. Default value 0. |
| 6 | SDET_ON | Silence detector enable. A 1-bit value to enable the digital silence detector. When this bit is logic 0 : silence detection circuit disabled. When this bit is logic 1: silence detection circuit enabled. Default value 0 . |
| 5 and 4 | SD_VALUE[1:0] | Silence detector settings. A 2-bit value to program the silence detector, the number of 'ZERO' samples counted before the silence detector signals whether there has been digital silence. Default value 00, see Table 49. |
| 3 and 2 | - | default value 00 |
| 1 and 0 | OS[1:0] | Oversampling input settings. A 2-bit value to select the oversampling input mode. Default value 00, see Table 50. |

## Stereo audio coder-decoder for MD, CD and MP3

Table 48 Mixer signal control setting bits

| MIX_POS | MIX | FUNCTION |
| :---: | :---: | :--- |
| 0 | 0 | no mixing; default |
| 1 | 0 | volume of channel 1 is forced to 0 dB and volume of channel 2 is forced to $-\infty \mathrm{dB}$ |
| 0 | 1 | mixing is done before the sound processing: input signals are automatically scaled by <br> 6 dB in order to prevent clipping during adding; after the addition, the 6 dB scaling is <br> compensated |
| 1 | 1 | mixing is done after the sound processing: input signals are automatically scaled in <br> order to prevent clipping during adding |

Table 49 Silence detector setting bits

| SD_VALUE1 | SD_VALUE0 | FUNCTION |
| :---: | :---: | :--- |
| 0 | 0 | 3200 samples; default |
| 0 | 1 | 4800 samples |
| 1 | 0 | 9600 samples |
| 1 | 1 | 19200 samples |

Table 50 Oversampling input setting bits

| OS1 | OS0 | FUNCTION |
| :---: | :---: | :--- |
| 0 | 0 | single-speed input is normal input; mixing possible; default |
| 0 | 1 | double-speed input is after first half-band; no mixing possible |
| 1 | 0 | quad-speed input is in front of noise shaper; no mixing possible |
| 1 | 1 | reserved |

### 11.11 Decimator volume control

Table 51 Register address 20H

| Default | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

Table 58 Description of register bits

| BIT | SYMBOL | DESCRIPTION |
| :---: | :--- | :--- |
| 15 to 13 | - | default value 000 |
| 12 | ADCPOL_INV | ADC polarity control. A 1-bit value to select ADC polarity. When this bit is logic $0:$ <br> polarity of ADC non-inverting. When this bit is logic 1: polarity of ADC inverting. <br> Default value 0. |
| 11 to 8 | VGA_CTRL[3:0] | Microphone input VGA gain settings. A 4-bit value to program the gain of the LNA <br> in the microphone input channel. The range is 0 to 30 dB in steps of 2 dB. <br> Default value 0000, see Table 59. |

Stereo audio coder-decoder
for MD, CD and MP3
UDA1380

| BIT | SYMBOL | DESCRIPTION |
| :---: | :--- | :--- |
| 7 to 4 | - | default value 0000 |
| 3 | SEL_LNA | Line input select. A 1-bit value to set the multiplexer in the analog front-end to select <br> between the LNA or the enable-in input for the left ADC. When this bit is logic 0: select <br> line input. When this bit is logic 1: select LNA for the left ADC. Default value 0. |
| 2 | SEL_MIC | Microphone input select. A 1-bit value to set the multiplexer at the ADC right <br> channel output (on bit-stream level) which selects either the right channel data or the <br> left channel data. In case only the microphone input is used, the microphone signal <br> can be applied to the decimator for both left and right. When this bit is logic 0: select <br> right channel ADC. When this bit is logic 1: select left channel ADC (for instance for <br> microphone input). Default value 0. |
| 1 | SKIP_DCFIL | DC filter bypass. A 1-bit value set to skip the DC filter which is just before the <br> decimator. This DC filter is there to compensate for the DC offset added in the ADC (to <br> remove idle tones from the audio band). This DC signal added (the DC dither) must <br> not be amplified in order to prevent clipping. Therefore this DC offset is removed first. <br> When this bit is logic 0: DC filter enabled. When this bit is logic 1: DC filter bypassed. <br> Default value 1. |
| 0 | EN_DCFIL | DC filter enable. A 1-bit value set to enable the DC filter which is at the output of the <br> decimator (running at 1f $\mathrm{m}_{\mathrm{s}}$ ). When this bit is logic 0: DC filter disabled. When this bit is <br> logic 1: DC filter enabled. Default value 0. |

| Symbol | - | - | - | - | AGC_LEVEL1 | AGC_LEVELO | - | AGC_EN |
| Default | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 61 Description of register bits

| BIT | SYMBOL | DESCRIPTION |
| :---: | :--- | :--- |
| 15 to 11 | - | Default value 00000. |
| 10 to 8 | AGC_TIME[2:0] | AGC time constant settings. A 3-bit value to set the AGC time constants, being the <br> attack and decay time constants. The given constants are for 44.1 and 8 kHz <br> sampling frequencies, and must be scaled either down or up according to the <br> sampling frequency used. Default value 000, see Table 62. |
| 7 to 4 | - | default value 0000 |
| 3 and 2 | AGC_LEVEL[1:0] | AGC target level settings. A 2-bit value to set the AGC target level. <br> Default value 00, see Table 63. |
| 1 | - | default value 0 |
| 0 | AGC_EN | AGC enable control. A 1-bit value to enable or disable the AGC. When the AGC is <br> enabled, the bit SKIP_DCFIL must be set to logic 0 to avoid disturbance on the <br> output signal due to the DC offset added in the ADC. When this bit is logic 0: AGC off, <br> manual gain control via the left and right decimator volume control. When this bit is <br> logic 1: AGC enabled, with manual microphone gain setting via VGA. Default value 0. |

Table 62 AGC time constant setting bits

Table 68 Description of register bits

| BIT | SYMBOL | DESCRIPTION |
| :---: | :--- | :--- |
| 15 to 5 | - | not used |
| 4 | AGC_STAT | AGC gain status. A 1-bit value which signals whether the AGC gain exceeds <br> 8 dB or not. Only valid when the AGC is switched on. When this bit is logic 0: <br> AGC gain <8 dB. When this bit is logic 1: AGC gain $\geq 8$ dB. |
| 3 | - | not used |
| 2 | MT_ADC_STAT | Decimator mute. A 1-bit value which signals whether the decimator has <br> reached mute or not. When this bit is logic 0: decimator has not muted. When <br> this bit is logic 1: decimator has muted. |
| 1 | - | not used |
| 0 | OVERFLOW | Digital output overflow detection. A 1-bit value which signals whether the <br> digital output amplitude exceeds -1.16 dB or not. When this bit is logic 0: no <br> overflow detected (read-out). When this bit is logic 1: overflow detected <br> (read-out). |

## Stereo audio coder-decoder <br> for MD, CD and MP3

## 12 LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 60134).

| SYMBOL | PARAMETER | CONDITIONS | MIN. | MAX. | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $V_{\text {DD }}$ | supply voltage | note 1 | - | 4 | V |
| $\mathrm{T}_{\text {xtal(max) }}$ | maximum crystal temperature |  | - | 150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {stg }}$ | storage temperature |  | -65 | +125 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {amb }}$ | ambient temperature |  | -40 | +85 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{V}_{\text {es }}$ | electrostatic handling voltage | note 2 | -2000 | +2000 | V |
|  |  | note 3 | -200 | +200 | V |
| $\mathrm{I}_{\text {u(prot) }}$ | latch-up protection current | $\mathrm{T}_{\text {amb }}=125^{\circ} \mathrm{C} ; \mathrm{V}_{\mathrm{DD}}=3.6 \mathrm{~V}$ | - | 100 | mA |
| 1 sc (DAC) | short-circuit current of DAC | $\begin{aligned} & \mathrm{T}_{\mathrm{amb}}=0^{\circ} \mathrm{C} ; \mathrm{V}_{\mathrm{DD}}=3 \mathrm{~V} ; \text { note } 4 \\ & \text { output short-circuited to } \mathrm{V}_{\mathrm{SSA}(\mathrm{DA})} \\ & \text { output short-circuited to } \mathrm{V}_{\mathrm{DDA}(\mathrm{DA})} \\ & \hline \end{aligned}$ | \|- | $\begin{array}{\|l\|} \hline 450 \\ 325 \\ \hline \end{array}$ | $\begin{array}{\|l} \hline \mathrm{mA} \\ \mathrm{~mA} \\ \hline \end{array}$ |

## Notes

1. All supply connections must be made to the same power supply.
2. Equivalent to discharging a 100 pF capacitor via a $1.5 \mathrm{k} \Omega$ series resistor.
3. Equivalent to discharging a 200 pF capacitor via a $0.75 \mu \mathrm{H}$ series inductor.
4. DAC operation after short-circuiting cannot be warranted.

## 13 HANDLING

Inputs and outputs are protected against electrostatic discharge in normal handling. However, to be totally safe, it is advised to take normal precautions appropriate to handling MOS devices.

## 14 THERMAL CHARACTERISTICS

| SYMBOL | PARAMETER | CONDITIONS | VALUE | UNIT |
| :--- | :--- | :--- | :---: | :---: |
| $\mathrm{R}_{\text {th(i-a) }}$ | thermal resistance from junction to ambient | in free air |  |  |
|  | TSSOP32 package |  | 115 | K/W |
|  | HVQFN32 package |  | 35 | K/W |

## 15 QUALITY SPECIFICATION

In accordance with "SNW-FQ-611D".

## Stereo audio coder-decoder for MD, CD and MP3

UDA1380

## 16 DC CHARACTERISTICS

$\mathrm{V}_{\mathrm{DDD}}=\mathrm{V}_{\mathrm{DDA}(\mathrm{AD})}=\mathrm{V}_{\mathrm{DDA}(\mathrm{DA})}=\mathrm{V}_{\mathrm{DDA}(H P)}=3.0 \mathrm{~V} ; \mathrm{T}_{\mathrm{amb}}=25^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{L}}=5 \mathrm{k} \Omega$; all voltages measured with respect to ground; unless otherwise specified.

## Notes

1. All supply connections must be made to the same power supply unit.
2. When the supply voltages are below 2.7 V and the headphone load impedance is $16 \Omega$, it is recommended to limit the DAC and the headphone output to less than -2 dB , otherwise clipping may occur.
3. $V_{D D A}=V_{D D A(D A)}=V_{D D A(A D)}$.
4. When higher capacitive loads must be driven, a $100 \Omega$ resistor must be connected in series with the DAC output in order to prevent oscillations in the output operational amplifier.

| $\mathrm{C}_{\mathrm{b}}$ | capacitive load for each bus line |  | - | - | 400 | pF |

## Notes

1. The typical value of the timing is specified at 48 kHz sampling frequency (see Fig.16).
2. $\mathrm{T}_{\mathrm{cy}(\mathrm{s})}$ is the cycle time of the sample frequency.
3. In order to prevent digital noise interfering with the L3-bus communication, it is best to have the rise and fall times as short as possible.
4. When the sampling frequency is below 32 kHz , the L3CLOCK cycle must be limited to $1 / 64 \mathrm{fs}$ cycle.
5. $\mathrm{C}_{\mathrm{b}}$ is the total capacitance of one bus line in pF . The maximum capacitive load for each bus line is 400 pF .
6. After this period, the first clock pulse is generated.
7. To be suppressed by the input filter.

# Stereo audio coder-decoder for MD, CD and MP3 

## 21 SOLDERING

### 21.1 Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "Data Handbook IC26; Integrated Circuit Packages" (document order number 9398652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended.

### 21.2 Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement. Driven by legislation and environmental forces the worldwide use of lead-free solder pastes is increasing.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 to $270^{\circ} \mathrm{C}$ depending on solder paste material. The top-surface temperature of the packages should preferably be kept:

- below $225^{\circ} \mathrm{C}$ (SnPb process) or below $245{ }^{\circ} \mathrm{C}$ (Pb-free process)
- for all BGA, HTSSON-T and SSOP-T packages
- for packages with a thickness $\geq 2.5 \mathrm{~mm}$
- for packages with a thickness < 2.5 mm and a volume $\geq 350 \mathrm{~mm}^{3}$ so called thick/large packages.
- below $240{ }^{\circ} \mathrm{C}$ (SnPb process) or below $260{ }^{\circ} \mathrm{C}$ (Pb-free process) for packages with a thickness $<2.5 \mathrm{~mm}$ and a volume $<350 \mathrm{~mm}^{3}$ so called small/thin packages.

Moisture sensitivity precautions, as indicated on packing, must be respected at all times.

### 21.3 Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
- larger than or equal to 1.27 mm , the footprint longitudinal axis is preferred to be parallel to the transport direction of the printed-circuit board;
- smaller than 1.27 mm , the footprint longitudinal axis must be parallel to the transport direction of the printed-circuit board.
The footprint must incorporate solder thieves at the downstream end.
- For packages with leads on four sides, the footprint must be placed at a $45^{\circ}$ angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time of the leads in the wave ranges from 3 to 4 seconds at $250^{\circ} \mathrm{C}$ or $265^{\circ} \mathrm{C}$, depending on solder material applied, SnPb or Pb -free respectively.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

### 21.4 Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage ( 24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to $300^{\circ} \mathrm{C}$.

When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and $320^{\circ} \mathrm{C}$.

### 21.5 Suitability of surface mount IC packages for wave and reflow soldering methods

| PACKAGE $^{(1)}$ | SOLDERING METHOD |  |
| :--- | :--- | :--- |
|  | WAVE | REFLOW |

## Notes

1. For more detailed information on the BGA packages refer to the "(LF)BGA Application Note" (AN01026); order a copy from your NXP Semiconductors sales office.
2. All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the "Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods".
3. These transparent plastic packages are extremely sensitive to reflow soldering conditions and must on no account be processed through more than one soldering cycle or subjected to infrared reflow soldering with peak temperature exceeding $217^{\circ} \mathrm{C} \pm 10^{\circ} \mathrm{C}$ measured in the atmosphere of the reflow oven. The package body peak temperature must be kept as low as possible.
4. These packages are not suitable for wave soldering. On versions with the heatsink on the bottom side, the solder cannot penetrate between the printed-circuit board and the heatsink. On versions with the heatsink on the top side, the solder might be deposited on the heatsink surface.
5. If wave soldering is considered, then the package must be placed at a $45^{\circ}$ angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
6. Wave soldering is suitable for LQFP, TQFP and QFP packages with a pitch (e) larger than 0.8 mm ; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm .
7. Wave soldering is suitable for SSOP, TSSOP, VSO and VSSOP packages with a pitch (e) equal to or larger than 0.65 mm ; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm .
8. Image sensor packages in principle should not be soldered. They are mounted in sockets or delivered pre-mounted on flex foil. However, the image sensor package can be mounted by the client on a flex foil by using a hot bar soldering process. The appropriate soldering profile can be provided on request.
9. Hot bar or manual soldering is suitable for PMFP packages

| :---: |$\quad$ DEFINITION

## Notes

1. Please consult the most recently issued document before initiating or completing a design.
2. The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

## 23 DISCLAIMERS

Limited warranty and liability - Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes - NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.
Suitability for use - NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe
property or environmental damage. NXP Semiconductors accepts no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications - Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.
Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

## Stereo audio coder-decoder for MD, CD and MP3

Limiting values - Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

## Terms and conditions of commercial sale - NXP

 Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.No offer to sell or license - Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Export control - This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from national authorities.

Quick reference data - The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.

Non-automotive qualified products - Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.
