PACDN006

6-Channel ESD Protection Array

Product Description

The PACDN006 is a diode array designed to provide six channels of ESD protection for electronic components or subsystems. Each channel consists of a pair of diodes that steer an ESD current pulse to either the positive (V_P) or negative (V_N) supply. The PACDN006 protects against ESD pulses up to:

- ± 8 kV contact discharge, per International Standard IEC 61000-4-2
- ± 15 kV per Human Body Model MIL-STD-883, Method 3015 (based on a 100 pF capacitor discharging through a 1.5 k Ω resistor)

This device is particularly well-suited for portable electronics (e.g., cellular phones, PDAs, notebook computers) because of its small package footprint, high ESD protection level, and low loading capacitance. It is also suitable for protecting video output lines and I/O ports in computers and peripherals and is ideal for a wide range of consumer electronics products.

The PACDN006 is available with RoHS compliant lead-free finishing.

Features

- Six Channels of ESD Protection
- ± 8 kV Contact, ± 15 kV Air ESD Protection per Channel (IEC 61000-4-2 Standard)
- ± 15 kV of ESD Protection per Channel (HBM)
- Low Loading Capacitance (3 pF Typical)
- Low Leakage Current is Ideal for Battery-Powered Devices
- Available in Miniature 8-Pin MSOP and 8-Pin SOIC Packages
- These Devices are Pb-Free and are RoHS Compliant

Applications

- Consumer Electronic Products
- Cellular Phones
- PDAs
- Notebook Computers
- Desktop PCs
- Digital Cameras and Camcorders
- VGA (Video) Port Protection for Desktop and Portable PCs

SPECIFICATIONS

Table 2. ABSOLUTE MAXIMUM RATINGS

Parameter	Rating	Units
Supply Voltage ($V_P - V_N$)	6.0	V
Diode Forward DC Current (Note 1)	20	mA
Operating Temperature Range	-40 to +85	°C
Storage Temperature Range	-65 to +150	°C
DC Voltage at any Channel Input	($V_N - 0.5$) to ($V_P + 0.5$)	V
Package Power Rating	200	mW

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. Only one diode conducting at a time.

Table 3. STANDARD OPERATING CONDITIONS

Parameter	Rating	Units
Operating Temperature Range	-40 to +85	°C
Operating Supply Voltage ($V_P - V_N$)	0 to 5.5	V

Table 4. ELECTRICAL OPERATING CHARACTERISTICS (Note 1)

Symbol	Parameter	Conditions	Min	Typ	Max	Units
I_P	Supply Current	($V_P - V_N$) = 5.5 V			10	μA
V_F	Diode Forward Voltage	$I_F = 20$ mA	0.65		0.95	V
I_{LEAK}	Channel Leakage Current			±0.1	±1.0	μA
C_{IN}	Channel Input Capacitance	@ 1 MHz, $V_P = 5$ V, $V_N = 0$ V, $V_{IN} = 2.5$ V		3	5	pF
V_{ESD}	ESD Protection Peak Discharge Voltage at any Channel Input, in System a) Human Body Model, MIL-STD-883, Method 3015 b) Contact Discharge per IEC 61000-4-2 c) Air Discharge per IEC 61000-4-2	(Note 2) (Note 3) (Note 4) (Note 4)	±15 ±8 ±15			kV
V_{CL}	Channel Clamp Voltage Positive Transients Negative Transients	@ 15 kV ESD HBM			$V_P + 13.0$ $V_N - 13.0$	V

1. All parameters specified at $T_A = 25^\circ\text{C}$ unless otherwise noted. $V_P = 5$ V, $V_N = 0$ V unless noted.
2. From I/O pins to V_P or V_N only. V_P bypassed to V_N with a 0.22 μF ceramic capacitor (see Application Information for more details).
3. Human Body Model per MIL-STD-883, Method 3015, $C_{Discharge} = 100$ pF, $R_{Discharge} = 1.5$ kΩ, $V_P = 5.0$ V, V_N grounded.
4. Standard IEC 61000-4-2 with $C_{Discharge} = 150$ pF, $R_{Discharge} = 330$ Ω, $V_P = 5.0$ V, V_N grounded.

PERFORMANCE INFORMATION

(V_P = 5 V, V_N = 0 V, 0.1 μF Chip Capacitor between V_P and V_N)

APPLICATION INFORMATION

Design Considerations

In order to realize the maximum protection against ESD pulses, care must be taken in the PCB layout to minimize parasitic series inductances on the Supply/Ground rails as well as the signal trace segment between the signal input (typically a connector) and the ESD protection device. Refer to Figure 2, which illustrates an example of a positive ESD pulse striking an input channel. The parasitic series inductance back to the power supply is represented by L₁ and L₂. The voltage V_{CL} on the line being protected is:

$$V_{CL} = \text{Fwd Voltage Drop of } D_1 + V_{SUPPLY} + L_1 \times d(I_{ESD})/dt + L_2 \times d(I_{ESD})/dt$$

where I_{ESD} is the ESD current pulse, and V_{SUPPLY} is the positive supply voltage.

An ESD current pulse can rise from zero to its peak value in a very short time. As an example, a level 4 contact discharge per the IEC61000-4-2 standard results in a current pulse that rises from zero to 30 Amps in 1 ns. Here d(I_{ESD})/dt can be approximated by ΔI_{ESD}/Δt, or 30/(1x10⁻⁹). So just 10 nH of series inductance (L₁ and L₂ combined) will lead to a 300 V increment in V_{CL}!

Similarly for negative ESD pulses, parasitic series inductance from the V_N pin to the ground rail will lead to drastically increased negative voltage on the line being protected.

Another consideration is the output impedance of the power supply for fast transient currents. Most power supplies exhibit a much higher output impedance to fast transient current spikes. In the V_{CL} equation above, the V_{SUPPLY} term, in reality, is given by (V_{DC} + I_{ESD} x R_{OUT}), where V_{DC} and R_{OUT} are the nominal supply DC output voltage and effective output impedance of the power supply respectively. As an example, a R_{OUT} of 1 Ω would result in a 10 V increment in V_{CL} for a peak I_{ESD} of 10 A.

If the inductances and resistance described above are close to zero, the rail-clamp ESD protection diodes will do a good job of protection. However, since this is not possible in practical situations, a bypass capacitor must be used to absorb the very high frequency ESD energy. So for any brand of rail-clamp ESD protection diodes, a bypass capacitor should be connected between the V_P pin of the diodes and the ground plane (V_N pin of the diodes) as shown in the Application Circuit diagram below. A value of 0.22 μF is adequate for IEC-61000-4-2 level 4 contact discharge protection (±8 kV). Ceramic chip capacitors mounted with short printed circuit board traces are good choices for this application. Electrolytic capacitors should be avoided as they have poor high frequency characteristics. For extra protection, connect a zener diode in parallel with the bypass capacitor to mitigate

PACDN006

the effects of the parasitic series inductance inherent in the capacitor. The breakdown voltage of the zener diode should be slightly higher than the maximum supply voltage.

As a general rule, the ESD Protection Array should be located as close as possible to the point of entry of expected electrostatic discharges. The power supply bypass capacitor mentioned above should be as close to the V_P pin of the Protection Array as possible, with minimum PCB trace lengths to the power supply, ground planes and between the signal input and the ESD device to minimize stray series inductance.
