## Positive Overvoltage Protection Controller with Internal Low $R_{ON}$ NMOS FET

The NCP349 is able to disconnect the systems from its output pin when wrong input operating conditions are detected. The system is positive overvoltage protected up to +28 V.

This device uses an internal NMOS and therefore, no external device is necessary, reducing the system cost and the PCB area of the application board.

The NCP349 is able to instantaneously disconnect the output from the input, due to integrated Low  $R_{ON}$  Power NMOS (65 m $\Omega$ ), if the input voltage exceeds the overvoltage threshold (OVLO) or falls below the undervoltage threshold (UVLO).

At powerup ( $\overline{EN}$  pin = low level), the  $V_{out}$  turns on  $t_{on}$  time after the  $V_{in}$  exceeds the undervoltage threshold.

The NCP349 provides a negative going flag ( $\overline{FLAG}$ ) output, which alerts the system that a fault has occurred.

In addition, the device has ESD-protected input (15 kV Air) when bypassed with a 1.0  $\mu$ F or larger capacitor.

### Features

- Overvoltage Protection up to 28 V
- On-Chip Low  $R_{DS(on)}$  NMOS Transistor: 65 m $\Omega$
- Internal Charge Pump
- Overvoltage Lockout (OVLO)
- Undervoltage Lockout (UVLO)
- Soft-Start
- Alert  $\overline{FLAG}$  Output
- Shutdown  $\overline{EN}$  Input
- Compliance to IEC61000-4-2 (Level 4)  
8.0 kV (Contact)  
15 kV (Air)
- ESD Ratings: Machine Model = B  
Human Body Model = 2
- DFN6 1.6x2 mm Package
- This is a Pb-Free Device

### Applications

- Cell Phones
- Camera Phones
- Digital Still Cameras
- Personal Digital Applications
- MP3 Players

## PIN FUNCTION DESCRIPTION

Pin No.	Symbol	Function	Description
1, 7	IN	INPUT	Input Voltage Pins. These pins are connected to the Wall Adapter (AC-DC, Vbus ..). A 1 $\mu$ F low ESR ceramic capacitor, or larger, must be connected between these pins and GND, as close as possible to the DUT. The two IN pins must be connected together to power supply. (See PCB recommendation for the pin7).
2	GND	POWER	Ground
3	FLAG	OUTPUT	Fault Indication Pin. This pin allows an external system to detect a fault on the IN pins. The FLAG pin goes low when input voltage exceeds OVLO threshold or drops below UVLO threshold. Since the FLAG pin is open drain functionality, an external pull-up resistor to V <sub>CC</sub> must be added. (Minimum 10 k $\Omega$ ).
4, 5	OUT	OUTPUT	Output Voltage Pins. These pins follow IN pins when “no fault” is detected. The two OUT pins must be hardwired together.
6	EN	INPUT	Enable Pin. The device enters in shutdown mode when this pin is tied to a high level. In this case the output is disconnected from the input. To allow normal functionality, the EN pin shall be connected to GND to a pull down or to a I/O pin. This pin does not have an impact on the fault detection.

## MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Minimum Voltage (IN to GND)	V <sub>min<sub>in</sub></sub>	-0.3	V
Minimum Voltage (All others to GND)	V <sub>min</sub>	-0.3	V
Maximum Voltage (IN to GND)	V <sub>max<sub>in</sub></sub>	30	V
Maximum Voltage (All others to GND)	V <sub>max</sub>	7.0	V
Maximum Current (UVLO < V <sub>IN</sub> < OVLO)	I <sub>max</sub>	2.0	A
Maximum Peak Current (t $\leq$ 1 ms, T <sub>A</sub> = 85°C)	I <sub>max<sub>peak</sub></sub>	4.0	A
Thermal Resistance, Junction-to-Air (Note 1)	R <sub><math>\theta</math>JA</sub>	180	°C/W
Operating Ambient Temperature Range	T <sub>A</sub>	-40 to +85	°C
Storage Temperature Range	T <sub>stg</sub>	-65 to +150	°C
Junction Operating Temperature	T <sub>J</sub>	150	°C
ESD Withstand Voltage (IEC 61000-4-2) (input only) when bypassed with 1.0 $\mu$ F capacitor Human Body Model (HBM), Model = 2 (Note 2) Machine Model (MM) Model = B (Note 3)	V <sub>esd</sub>	15 Air, 8.0 Contact 2000 200	kV V V
Moisture Sensitivity	MSL	Level 1	-

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. The R <sub>$\theta$ JA</sub> is highly dependent on the PCB heat sink area (connected to pin 7).
2. Human Body Model, 100 pF discharged through a 1.5 k $\Omega$  resistor following specification JESD22/A114.
3. Machine Model, 200 pF discharged through all pins following specification JESD22/A115.

# NCP349

Figure 16. Simplified Diagram

Figure 17. Simplified Diagram

## Operation

The NCP349 provides overvoltage protection for positive voltage, up to 28 V. A low  $R_{DS(on)}$  NMOSFET protects the systems (i.e.: charger) connected on the  $V_{out}$  pin, against positive overvoltage. At powerup, with  $\overline{EN}$  pin = low, the output is rising up  $t_{on}$  soft-start after the input

overtaking undervoltage UVLO (Figure 3). The NCP349 provides a  $\overline{FLAG}$  output, which alerts the system that a fault has occurred. A  $t_{start}$  additional delay, regarding available output (Figure 3) is added between output signal rising up and to  $\overline{FLAG}$  signal rising up.  $\overline{FLAG}$  pin is an open drain output.

# NCP349

Figure 18. State Machine

**Undervoltage Lockout (UVLO)**

To ensure proper operation under any conditions, the device has a built-in undervoltage lockout (UVLO) circuit. During  $V_{in}$  positive going slope, the output remains disconnected from input until  $V_{in}$  voltage is below UVLO, plus hysteresis, nominal. The  $\overline{FLAG}$  output is tied to low as long as  $V_{in}$  does not reach UVLO threshold. This circuit has a built-in hysteresis to provide noise immunity to transient condition. Additional UVLO thresholds ranging from UVLO can be manufactured. Contact your ON Semiconductor representative for availability.

**Overvoltage Lockout (OVLO)**

To protect connected systems on  $V_{out}$  pin from overvoltage, the device has a built-in overvoltage lockout (OVLO) circuit. During overvoltage condition, the output remains disabled as long as the input voltage exceeds typical OVLO. Additional OVLO thresholds ranging from OVLO can be manufactured. Contact your ON Semiconductor representative for availability.

$\overline{FLAG}$  output is tied to low until  $V_{in}$  is higher than OVLO. This circuit has a built-in hysteresis to provide noise immunity to transient conditions.

**$\overline{FLAG}$  Output**

The NCP349 provides a  $\overline{FLAG}$  output, which alerts external systems that a fault has occurred.

This pin is tied to low as soon the OVLO threshold is exceeded or when the  $V_{in}$  level is below the UVLO threshold. When  $V_{in}$  level recovers normal condition,  $\overline{FLAG}$  is held high, keeping in mind that an additional  $t_{start}$  delay has been added between available output and  $\overline{FLAG}$  = high. The pin is an open drain output, thus a pull up resistor (typically 1 M $\Omega$ , minimum 10 k $\Omega$ ) must be added to  $V_{bat}$ . Minimum  $V_{bat}$  supply must be 2.5 V. The  $\overline{FLAG}$  level will always reflects  $V_{in}$  status, even if the device is turned off ( $\overline{EN} = 1$ ).

**$\overline{EN}$  Input**

To enable normal operation, the  $\overline{EN}$  pin shall be forced to low or connected to ground. A high level on the pin, disconnects OUT pin from IN pin.  $\overline{EN}$  does not overdrive an OVLO or UVLO fault.

**Internal NMOS FET**

The NCP349 includes an internal Low  $R_{DS(on)}$  NMOS FET to protect the systems, connected on OUT pin, from positive overvoltage. Regarding electrical characteristics, the  $R_{DS(on)}$ , during normal operation, will create low losses on  $V_{out}$  pin.

As example:  $R_{load} = 8.0 \Omega$ ,  $V_{in} = 5.0 V$   
 Typical  $R_{DS(on)} = 65 m\Omega$ ,  $I_{out} = 618 mA$   
 $V_{out} = 8 \times 0.618 = 4.95 V$

NMOS losses =  $R_{DS(on)} \times I_{out}^2 = 0.065 \times 0.618^2 = 25 mW$

**ESD Tests**

The NCP349 input pin fully supports the IEC61000-4-2. 1.0  $\mu F$  (minimum) must be connected between  $V_{in}$  and GND, close to the device.

That means, in Air condition,  $V_{in}$  has a  $\pm 15 kV$  ESD protected input. In Contact condition,  $V_{in}$  has  $\pm 8.0 kV$  ESD protected input.

Please refer to Figure 19 to see the IEC 61000-4-2 electrostatic discharge waveform.

Figure 19. Electrostatic Discharge Waveform

**PCB Recommendations**

The NCP349 integrates a 2 A rated NMOSFET, and the PCB rules must be respected to properly evacuate the heat out of the silicon. The pin 7 (exposed pad) is internally connected to the internal NMOS Drain (Input). This exposed pad must be used to increase heat transfer and must be connected to Pin 1. Of course, in any case, this pad shall be not connected to any other potential.
