Hot Swap Smart Fuse

NCP81295, NCP81296

The NCP81295 and NCP81296 are 50 A, electronically re-settable, in-line fuses for use in 12 V, high current applications such as servers, storage and base stations. The NCP81295/6 offers a very low 0.65 m Ω integrated MOSFET to reduce solution size and minimize power loss. It also integrates a highly accurate current sensor for monitoring and overload protection.

Power Features

- Co-packaged Power Switch, Hotswap Controller and Current Sense
- Up to 60 A Peak Current Output, 50 A Continuous
- Vin Range: 4.5 V to 18 V
- 0.65 m Ω , no R_{SENSE} Required

Control Features

- Enable Input
- Optional Enable-controlled Output Pulldown when Disabled
- Programmable Soft-Start
- Programmable, Multi-level Current Limit

Reporting Features

- Accurate Analog Load Current Monitor
- Programmable Over Current Alert Output
- Analog Temperature Output
- Status Fault OK Output

Other Features

- 5 mm x 5 mm QFN32 Package
- Operating Temperature: -40°C to 125°C
- Can be Paralleled for Higher Current Applications
- Built-in Insertion Delay for Hotswap Applications
- NCP81295: Latch off for Following Protection Features
- NCP81296: Auto-Retry Mode for Following Protection Features
 - ◆ Current-limit after Delay
 - ◆ Fast Short-circuit Protection
 - ◆ Over-Temperature Shutdown
 - ◆ Excessive Soft-start Duration
- Internal Switch Fault Diagnostics
- Low-power Auxiliary Output Voltage

Table 2. PIN DESCRIPTION

Pin No.	Symbol	Description
1	NC4	No electrical connection internally. May connect to any potential
2	NC5	No electrical connection internally. May connect to any potential
3	D_OC	Overcurrent indicator output (open drain). Low indicates the NCP81295 is limiting current. The D_OC output does not report current limiting during soft-start.
4	ON	Enable input and output pulldown resistance control.
5	GOK	OK status indicator output (open drain). Low indicates that the NCP81295 was turned off by a fault.
6	NC1	Test pin. Do not connect to this pin. Leave floating
7	VINF	Control circuit power supply input. Connect to VIN pins through an RC filter. ($1\ \Omega / 0.1\ \mu\text{F}$)
8	NC2	Internal FET sense pin. Do not connect to this pin. Leave floating
9	VIN09	Input of high current output switch
10	VIN10	Input of high current output switch
11	VIN11	Input of high current output switch
12	VIN12	Input of high current output switch
13	VIN13	Input of high current output switch
14	VIN14	Input of high current output switch
15	VIN15	Input of high current output switch
16	VIN16	Input of high current output switch
17	GATE	Internal FET gate pin. Connect to the cathode of an anode grounded diode such as BAS16P2T5G. A 4.7 nF ceramic capacitor is reserved between this pin and GND for NCP81295 to mitigate the oscillation risk when small amount of output capacitance ($< 100\ \mu\text{F}$) or long input/output cable (large $L_{\text{IN}} / L_{\text{OUT}}$) happens.
18	VTEMP	Analog temperature monitor output.
19	SS	Soft Start time programming pin. Connect a capacitor to this pin to set the softstart time.
20	GND	Ground
21	VDD	Linear regulator output
22	IMON	Analog current monitor output
23	CS	Current sense feedback output (current). Scaling the voltage developed at this pin with a resistor to ground makes this also an input for several current limiting functions and overcurrent indicator D_OC.
24	CLREF	Current limit setpoint input for normal operation (after soft-start).
25	VOUT25	Output of high current output switch
26	VOUT26	Output of high current output switch
27	VOUT27	Output of high current output switch
28	VOUT28	Output of high current output switch
29	VOUT29	Output of high current output switch
30	VOUT30	Output of high current output switch
31	VOUT31	Output of high current output switch
32	VOUT32	Output of high current output switch
33	VIN33	Input of high current output switch

Table 3. MAXIMUM RATINGS

Rating	Symbol	Min	Max	Unit
Pin Voltage Range (Note 1) Vout enabled	VINx, VINf	-0.3	20	V
Pin Voltage Range (Note 1) Vout disabled (Note 2)	VINx, VINf	-0.3	30	V
Pin Voltage Range (Note 1)	VOUTx	-0.3 -1(<500 ms)	20	V
Pin Voltage Range (Note 1)	VDD	-0.3	6.0	V
Pin Voltage Range (Note 3)	All Other Pins	-0.3	VDD + 0.3	V
Operating Junction Temperature	T _{J(max)}		150	°C
Storage Temperature Range	T _{STG}	-55	150	°C
Lead Temperature Soldering Reflow (SMD Styles Only), Pb-Free Versions (Note 4)	T _{SLD}		260	°C
Electrostatic Discharge – Charged Device Model	ESD _{CDM}		2.0	kV
Electrostatic Discharge – Human Body Model	ESD _{HBM}		2.5	kV

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. All signals referenced to GND unless noted otherwise.
2. Vout disable is the state of output OFF when internal FET has turned off by disable ON or FAULTs protection.
3. Pin ratings referenced to VDD apply with VDD at any voltage within the VDD Pin Voltage Range.
4. For information, please refer to our Soldering and Mounting Techniques Reference Manual, SOLDERRM/D

Table 4. THERMAL CHARACTERISTICS

Rating	Symbol	Value	Unit
Thermal Resistance, Junction-to-Ambient (Note 5)	R _{θJA}	30	°C/W
Thermal Resistance, Junction-to-Top-Case	R _{θJCT}	50	°C/W
Thermal Resistance, Junction-to-Bottom-Case	R _{θJCB}	1.5	°C/W
Thermal Resistance, Junction-to-Board (Note 6)	R _{θJB}	1.5	°C/W
Thermal Resistance, Junction-to-Case (Note 7)	R _{θJC}	1.5	°C/W

5. R_{θJA} is obtained by simulating the device mounted on a 500 mm², 1-oz Cu pad on a 80 mm x 80 mm, 1.6 mm thick 8-layer FR4 board.
6. R_{θJB} value based on hottest board temperature within 1 mm of the package.
7. R_{θJC} ≈ R_{θJCT} // R_{θJCB} (Two-Resistor Compact Thermal Model, JESD15-3).

Table 5. RECOMMENDED OPERATING RANGES

Parameter	Symbol	Min	Max	Unit
VIN, VINf Pin Voltage Range		4.5	18	V
Maximum Continuous Output Current	I _{AVE}		50	A
Peak Output Current	I _{PEAK}		60	A
VDD Output Load Capacitance Range	C _{VDD}	2.2	10	μF
VTEMP Output Load Capacitance Range	C _{VTEMP}	0.1		μF
Softstart Duration	T _{SS}	10	100	ms
CS Load Resistance Range	R _{CS}	1.8	4	kΩ
CLREF Voltage Range	V _{CLREF}	0.2	1.4	V
Operating Junction Temperature	T _{J(OP)}	-40	125	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

NCP81295, NCP81296

Table 6. ELECTRICAL CHARACTERISTICS (VINx = VIN = 12.0 V, VON = 3.3 V, CVINF = 0.1 μ F, CVDD = 4.7 μ F, CVTEMP = 0.1 μ F, RVTEMP = 1 k Ω , CSS = 100 nF (unless specified otherwise) Min/Max values are valid for the temperature range $-40^{\circ}\text{C} \leq T_A = T_J \leq 125^{\circ}\text{C}$ unless noted otherwise, and are guaranteed by design and characterization through statistical correlation.

Parameter	Symbol	Test Conditions	Min	Typ	Max	Units
-----------	--------	-----------------	-----	-----	-----	-------

VINF INPUT

Quiescent Current		VON > 1.4 V, no load		3.23	5.0	mA
		VON > 1.4 V, fault			5.0	mA
		VON < 0.8 V		2.38	4.0	mA
		VON < 0.8 V, VIN = 16 V			4.0	mA

VDD REGULATOR

VDD Output Voltage	VDD_NL	IVDD = 0 mA, VIN = 6 V	4.7	5.09	5.3	V
VDD Load Capability	IDDL	VINF = 5.5 V			30	mA
VDD Current Limit	IDDL_CL	VINF = 12 V and VIN = 6 V	50	70		mA
VDD Dropout Voltage		IVDD = 25 mA, VIN = 4.5 V		85	200	mV
UVLO threshold – rising	VDD_UVR		4.1	4.3	4.5	V
UVLO threshold – falling	VDD_UVF		3.8	4.0	4.2	V

ON INPUT

Bias Current	ION	From pin into a 0 V or 1.5 V source	4.0	5.0	6.0	μ A
Switch ON Threshold	VSWON		1.33	1.4	1.47	V
Switch OFF/ Pulldown Upper Threshold	VSWOFF		1.13	1.2	1.27	V
Pulldown Lower Threshold	VPOFF			0.8		V
Switch ON Delay Timer	tON	From ON transitioning above VSWON to SS start	0.6	1.0	2.5	ms
Switch OFF Delay Time (Note 8)	tOFF	From ON transitioning below VSWOFF to GATE pulldown		1.7		μ s
ON Current Source Clamp Voltage	VON_CLMP	Max pullup voltage of current source		3.0		V
Load Pulldown Delay Timer	tPD_DEL	From ON transitioning into the range between VSWOFF and VPOFF		2.0		ms
Output Pulldown Resistance	RPD	VOUT = 12 V, PD mode = 1		0.77		k Ω

SS PIN

Bias Current	ISS	From pin into a 0 V or 1 V source	4.62	5.15	5.62	μ A
Gain to VOUT	AVSS		9.6	10	10.4	V/V
SS Pulldown Voltage	VOL_SS	0.1 mA into pin during ON delay		22		mV

GOK OUTPUT

Output Low Voltage	VOL_GOK	IGOK = 1 mA			0.1	V
Off-state Leakage Current	ILK_GOK	VGOK = 5 V			1.0	μ A

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

General Information

The NCP81295/6 is an N-channel MOSFET co-packaged with a smart hotswap controller. It is suited for high-side current limiting and fusing in hot-swap applications. It can be used either alone, or in a parallel configuration for higher current applications.

VDD Output (Auxiliary Regulated Supply)

An internal linear regulator draws current from the VIN pin to produce and regulate voltage at the VDD pin. This auxiliary output supply is current-limited to I_{DD_CL} . A ceramic capacitor in the range of 2.2 μF to 10 μF must be placed between the VDD and GND pins, as close to the NCP81295/6 as possible. The voltage difference between VIN and VIN pin voltage should be within 0.4 V for better CS/IMON performance. Small time constant R/C filter such as 1 Ω /0.1 μF on the VIN pin is recommended.

ON Input (Device Enable)

When the ON pin voltage (V_{ON}) is higher than V_{SWON} , and no undervoltage (UVLO) or output switch faults are present, the output switch turns on. When V_{ON} is lower than V_{SWOFF} , the output switch is off. If V_{ON} is between V_{PDOFF} and V_{SWOFF} for longer than t_{PD_DEL} , the output switches off, and a pulldown resistance to ground, of R_{PD} , is applied to VOUT. In other words, there is behavior as follows:

- When $V_{ON} < 0.8 \text{ V}$, FET turns off.
- When $0.8 \text{ V} < V_{ON} < 1.2 \text{ V}$, VOUT will discharge with $\sim 15 \text{ mA}$.
- When $V_{ON} > 1.2 \text{ V}$, FET turns on.

For standalone applications, the ON pin sources current I_{ON} , which can be used to delay output switch turn-on for some time after the appearance of input voltage by connecting a capacitor from the ON pin to ground.

A bi-level control signal driving to ground can be biased up with a resistive divider to produce ON input levels between $V_{PDOFF} < V_{ON} < V_{SWON}$ and $V_{ON} > V_{SWON}$ in order to always apply the output pulldown when the output switch is off.

SS Output (Soft-Start)

When the output switch first turns on, it does so in a controlled manner. The output voltage (VOUT) follows the voltage at the SS pin, produced by current I_{SS} into a capacitor from SS to ground. The duration of soft-start can be programmed by selection of the capacitor value. In parallel fuse applications, the SS pins of all fuses should be shorted together to one shared SS capacitor. Internal soft-start load balancing circuitry will ensure the soft-start current is shared between paralleled devices, so as not to stress one device more than another or hit a soft start-current limit.

The soft-start capacitor value can be calculated by:

$C_{SS} = (t_{SS} * I_{SS} * \Delta V_{SS}) / V_{IN}$ (where t_{SS} is the target soft-start time). The recommended range of t_{SS} is 10 – 100 ms (see Table 5).

The typical C_{SS} values for different t_{SS} are listed below:

t_{SS} (ms)	C_{SS} (nF)	t_{SS} (ms)	C_{SS} (nF)
10	47	60	270
20	82	70	330
30	120	80	330
40	180	90	470
50	220	100	470

The maximum load capacitor value NCP81295/6 can power up depends on the device soft-start time. When $V_{IN} = 12 \text{ V}$, $R_{CS} = 2 \text{ k}\Omega$, $R_{LOAD} = 2.4 \Omega$, their relationship for different paralleled operations are shown as below chart (above line device shuts down safely due to protection, below line device powers up successfully without trigger protection):

GOK Output (Gate OK)

The GOK pin is an open-drain output that is pulled low to report the fault under the following conditions:

- V_{DD} voltage is below UVLO voltage at any time.
- V_{ON} disabled and V_{DS_OK} is false (indicates a short from VIN to VOUT).
- V_{ON} disabled and V_{DG_OK} is false (indicates a short from GATE to VIN).
- V_{ON} enabled and V_{SS_OK} is false at t_{SSF_END} (indicates $V_{OUT} < 90\%$ after soft-start completes – FET latches off for NCP81295/auto-retries for NCP81296).
- V_{ON} enabled and V_G is below V_{G_TH} at t_{SSF_END} (indicates leakage on GATE in startup – FET latches off for NCP81295/auto-retries for NCP81296).
- V_{ON} enabled and V_G is below V_{G_TH} after t_{GATE_FLT} (indicates leakage on GATE during normal operation – FET latches off for NCP81295/auto-retries for NCP81296).
- V_{ON} enabled and a current-limiting condition lasts longer than t_{OC_LA} (FET latches off for NCP81295/auto-retries for NCP81296).

- V_{ON} enabled and device temperature is above T_{TSD} (indicates an over-temperature is detected – FET latches off for NCP81295/auto-retries for NCP81296).

Usually GOK can't be used as power good to indicate the output voltage is in the normal range. Bringing VDD below the UVLO voltage is required to release a latching condition.

IMON Output (Current Monitor)

The IMON pin sources a current that is A_{IMON} (10 $\mu A/A$) times the VOUT output current and plus I_{AZ_BIAS} . A resistor connected from the IMON pin to ground can be used to monitor current information as a voltage up to V_{IM_CLMP} . A capacitor of any value in parallel with the IMON resistor can be used to low-pass filter the IMON signal without affecting any internal operation of the device.

CLREF Pin (Current Limit and Over-Current Reference)

The CLREF pin voltage determines the current-limit regulation point and over-current indication point via its interaction with the CS pin voltage. The CLREF voltage can be applied by an external source, such as a hot-swap controller or D-to-A converter, or developed across a programming resistor to ground by the CLREF bias current, I_{CL} . The recommended range of CLREF voltage is 0.2 – 1.4 V (see Table 5).

CS Input/Output (Current Set)

The CS pin is both an input and an output. The CS pin sources a current that is A_{CS} (10 $\mu A/A$) times the VOUT current and plus I_{AZ_BIAS} . This produces a voltage on the CS pin that is the product of the CS pin current and an external CS pin resistance to ground.

The voltage generated on V_{CS} determines the D_OC over-current indicator trip point and the current-limit regulation point, via its interaction with the voltage on CLREF pin.

When the voltage on the CS pin is higher than V_{OC_TH} , D_OC is pulled low. If the CS pin voltage drops below V_{OC_TH} , the D_OC pin is released to and gets pulled high by the external pullup resistor. D_OC transitions based on the following formula:

$$I_{OUT} = \frac{\frac{V_{OC_TH} + V_{ENACT}}{R_{CS}} - I_{AZ_BIAS}}{10 \mu} \quad (\text{eq. 1})$$

The V_{OC_TH} trip point is based on a percentage of V_{CLREF} (86%).

During normal operation ($V_{ON} > V_{SWON}$ for longer than t_{SS_END}), if the voltage on the CS pin is above V_{CL_TH} (V_{CL_TH} is clamped at V_{CL_MX} if $V_{CL_TH} > V_{CL_MX}$), then the gate voltage of the FET is modulated to limit current into the output based on the following formula:

$$I_{OUT} = \frac{\frac{V_{CL_TH} + V_{ENACT}}{R_{CS}} - I_{AZ_BIAS}}{10 \mu} \quad (\text{eq. 2})$$

The V_{CL_TH} regulation point is equal to V_{CLREF} .

During startup ($V_{ON} > V_{SWON}$ for less than t_{SS_END}), the current limit reference voltage is clamped according to the following:

- When $V_{OUT} < 40\%$ of V_{IN} , $V_{CL_TH} = V_{CL_LO}$ or V_{CLREF} (whichever is lower).
- When V_{OUT} is between 40% and 80% of V_{IN} , $V_{CL_TH} = V_{CL_HI}$ or V_{CLREF} (whichever is lower).
- When V_{OUT} exceeds 80% of V_{IN} , $V_{CL_TH} = V_{CL_MX}$ or V_{CLREF} (whichever is lower).

If a current limiting condition exists anytime for a continuous duration $> t_{CL_LA}$, then the device latches off (NCP81295) or restarts (NCP81296).

The CS pin must have no capacitive loading other than parasitic device/board capacitance to function correctly. The recommended range of R_{CS} is 1.8 – 4 k Ω (see Table 5).

CS AMP OFFSET BIAS

NCP81295/6 use an auto-zero Op-Amp with low input offset to sense current in FET with high-accuracy, and an pre-biased offset current load, I_{AZ_BIAS} is need for this Op-Amp to always keep it to maintain this low input offset ($< 100 \mu V$). The internal IMON and CS current source follow below relationship:

$$I_{OUT} = \frac{I_{CS} - I_{AZ_BIAS}}{10 \mu} \quad (\text{eq. 3})$$

and

$$I_{OUT} = \frac{I_{MON} - I_{AZ_BIAS}}{10 \mu} \quad (\text{eq. 4})$$

For typical 5 μA I_{AZ_BIAS} , there has 0.5 A positive off-set in I_{OUT} sense.

D_OC Output (Over-current Indicator)

The D_OC pin is an open-drain output that indicates when an over-current condition exists after soft-start is complete. When the voltage on the CS pin is higher than V_{OC_TH} , D_OC is pulled low. If output current drops below V_{OC_TH} , the D_OC pin is released and gets pulled high by an external pullup resistor.

VTEMP Output (Temperature Indicator)

VTEMP is a voltage output proportional to device temperature, with an offset voltage. The VTEMP output can source much more current than it can sink, so that if multiple VTEMP outputs are connected together, the voltage of all VTEMP outputs will be driven to the voltage produced by the hottest NCP81295/6. A 100 nF capacitor or greater must be connected from the VTEMP pin to ground.

Auto-Retry Restart (NCP81296)

Under certain fault conditions, the FET is turned off and another soft-start procedure takes place. Between the fault and the new soft-start, there is a delay of t_{DLY_RETRY} . The protection features that use this hiccup mode restart are:

- Over-Current
- Short-Circuit Detection
- Over-Temperature
- Excessive Soft-Start Duration
- Gate Leakage

Protection Features

For the following protection features, the FET either latches off (NCP81295) or the FET turns off and initiates a restart (NCP81296), unless noted otherwise.

Excessive Current Limiting

If a current limiting condition exists anytime for a continuous duration $> t_{CL_LA}$, then the FET latches/restarts.

Excessive Soft-Start Duration

If $V_{OUT} < V_{OUTL_TH}$ when t_{SS_END} expires, then the FET latches/restarts.

Short Circuit Detection

If switch current exceeds I_{SC} , the device reacts within t_{SC} , and the FET latches/restarts. The short-circuit current monitor is independent of CS, CLREF, IMON and current limit setting (cannot be changed externally).

Over-Temperature Shutdown

If the FET controller temperature $> T_{TSD}$, then the FET latches/restarts.

FET Fault Detection

The device contains various FET monitoring circuits:

- VIN to VOUT short, non-latching/non-auto-retry condition. If the device is disabled and $V_{OUT} > V_{DS_TH}$ then GOK is pulled low and the device is prevented from powering up. The device is allowed to power up once $V_{OUT} < V_{DS_OK}$.
- GATE to VIN short, non-latching/non-auto-retry condition. If the device is disabled and $GATE (Pin 8) > V_{DG_TH}$, then GOK is pulled low and device is prevented from powering up. The device is allowed to power up once $GATE < V_{DG_OK}$.
- GATE leakage – startup.
If $(GATE - V_{INF}) < V_{G_TH}$ at t_{SS_END} , then GOK is pulled low and FET latches/restarts.
- GATE leakage – normal operation.
If $(GATE - V_{INF}) < V_{G_TH}$ for t_{GATE_FLT} time after the soft-start timer completes, then GOK is pulled low and device latches/restarts.

FET SOA Limits

In-built timed current limits and fault-monitoring circuits ensure the copackaged FET is always kept within SOA limits.

Multiple Fuse Power Up

When multiple NCP81295 are paralleled together as shown in Figure 4, the NCP81295s will turn on together. Keeping the current through each switch within 1 A (typical) helps to prevent overstress on each switching during soft-start.

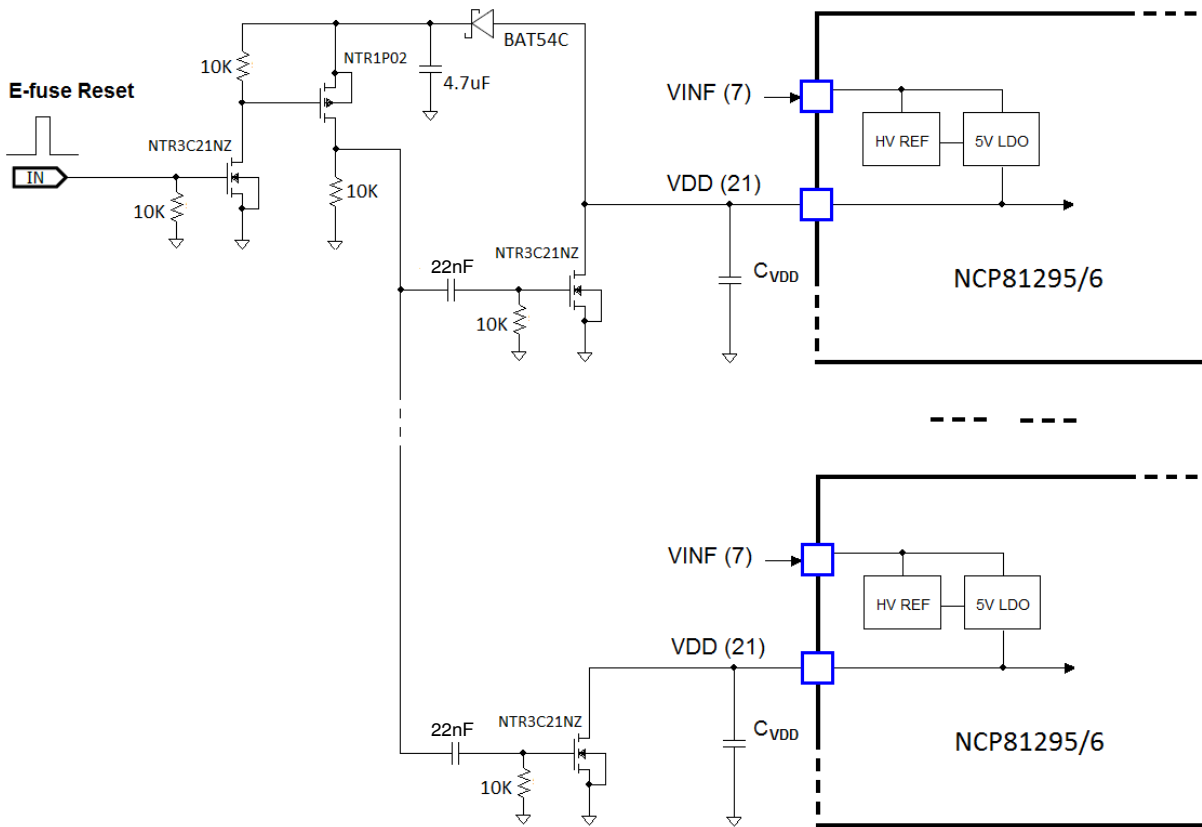

Due to NCP81296 is featured by Auto-Retry Mode protection, please follow the below reference schematic of NCP81296 for paralleled operation.

NCP81295, NCP81296

When paralleled multiple NPC81295 encounter fault, the system can recover the E-fuse by resetting their VDD with below buffer and reset circuit.

NCP81295, NCP81296

MECHANICAL CASE OUTLINE PACKAGE DIMENSIONS

ON Semiconductor®

ON

LQFN32 5x5, 0.5P
CASE 487AA
ISSUE A

DATE 03 OCT 2017

NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. CONTROLLING DIMENSION: MILLIMETERS.
3. DIMENSION b APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN 0.15 AND 0.30 MM FROM THE TERMINAL TIP.
4. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.

MILLIMETERS		
DIM	MIN	MAX
A	1.20	1.40
A1	---	0.05
A3	0.20	REF
b	0.18	0.30
D	5.00	BSC
D2	3.30	3.50
E	5.00	BSC
E2	3.30	3.50
e	0.50	BSC
L	0.30	0.50
L2	0.13	REF

GENERIC MARKING DIAGRAM*

XXXXXX = Specific Device Code
A = Assembly Location
WL = Wafer Lot
YY = Year
WW = Work Week
▪ = Pb-Free Package

(Note: Microdot may be in either location)

*This information is generic. Please refer to device data sheet for actual part marking.

Pb-Free indicator, "G" or microdot "▪", may or may not be present. Some products may not follow the Generic Marking.

RECOMMENDED SOLDERING FOOTPRINT*
