The typical application of this device is a reflective or beam break sensor with active low "detect" or "no detect" information contained in its output. Applications requiring up to 2 m beam break or 1 m reflective range benefit from the lower gain of these sensors because they are less sensitive to stray signal from the emitter, simplifying the mechanical design.

Example for a sensor hardware:

Separation to avoid crosstalk by stray light inside the housing

There should be no common window in front of the emitter and detector in order to avoid crosstalk via guided light through the window.
