

2:1 Mux/DeMux Gigabit Ethernet LAN Switch with Power-down Mode

Features

- 1:2 Gigabit LAN Switch
- Power-down support
- Low bit-to-bit skew: 200ps
- Very Low Crosstalk: -75dB @ 250MHz
- Status Indicator LEDs Switched with Ethernet pairs
- V_{DD} Operating Range: +3.0V to +3.6V
- Enhanced ESD Protection (on A, B, C, LED pins):
 - 8kV (contact)⁽¹⁾
 - 1.0kV (machine model),
 - 11kV (human body model)
- >650 MHz bandwidth
- Packaging:
 - 42-contact TQFN (3.5 x 9mm, 0.5 pitch)

Description

The PI3L720 is a 8-Channel 2:1 multiplexer/demultiplexer LAN Switch with Hi-Z outputs. Industry leading advantages include a propagation delay of less than 250ps, resulting from its low channel resistance and I/O capacitance. The device multiplexes differential outputs from a Gigabit Ethernet transceiver (PHY) device to one of two corresponding B or C outputs. The switch is bidirectional and offers little or no attenuation of the high-speed signals at the outputs. It is designed for low bit-to-bit skew, high channel-to-channel noise isolation and is compatible with various standards, such as 10/100/1000 Base-T (Ethernet).

The PI3L720 provides a Power Down input (PD), which can put the device into standby mode (PD=1) while mobile, eliminating an external power switch.

Generally, this part can be used to replace mechanical relays in low-voltage LAN applications that interface a physical layer over CAT 5 or CAT 6 unshielded twisted pair cable through an isolation transformer.

Block Diagram

Applications

- Dual Physical Layer Device sharing to one interface connector, or one controller to dual connectors for docking
- Routes signals for 10/100/1000 Mbit Ethernet

Maximum Ratings

(Above which useful life may be impaired. For user guidelines, not tested.)

Storage Temperature.....	-65°C to +150°C
Supply Voltage to Ground Potential	-0.5V to +4.0V
DC Input Voltage.....	-0.5V to +5.5V
DC Output Current.....	120mA
Power Dissipation	0.5W

Note:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

C_{IN}	Input Capacitance	$V_{IN} = 0\text{V}, f = 1\text{MHz}$		2.0	3.0	pF
$C_{OFF(B1, B2)}$	Port B Capacitance, Switch OFF			3.0	6.0	
$C_{ON(A/B)}$	A/B Capacitance, Switch ON			8.0	11.0	

Notes:

- For max. or min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device type.
- Typical values are at $V_{DD} = 3.3\text{V}$, $T_A = 25^{\circ}\text{C}$ ambient and maximum loading.
- Measured by the voltage drop between A and B pins at indicated current through the switch. ON resistance is determined by the lower of the voltages on the two (A & B) pins.
- This parameter is determined by device characterization but is not production tested.

Power Supply Characteristics

$I_{DD\text{-PD}}^{(3)}$	Power Down Current	$\text{PD} = 1, V_{DD} = \text{MAX}, V_{IN} = V_{DD} \text{ or } \text{GND}$		0.15	0.25	mA

Notes:

- For max. or min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device type.
- Typical values are at $V_{DD} = 3.3\text{V}$, $T_A = 25^{\circ}\text{C}$ ambient and maximum loading..
- Active power represents normal data communication. Standby power is when the device is enabled for operation but there is no LAN traffic (cable not connected). Power down current is the minimum power state used when not connected and mobile.
- The bus switch contributes no propagational delay other than the RC delay of the ON resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25ns for 10pF load. Since this time constant is much smaller than the rise/fall times of typical driving signals, it adds very little propagational delay to the system. Propagational delay of the bus switch when used in a system is determined by the driving circuit on the driving side of the switch and its interactions with the load on the driven side.

Switching Waveforms

Voltage Waveforms Propagation Delay Times

Voltage Waveforms Enable and Disable Times

Output Skew - tSK(o)

Pulse Skew - tSK(p)

Notes:

- Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control.
- Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
- All input impulses are supplied by generators having the following characteristics: PRR ≤ MHz, ZO = 50-Ohm, tr ≤ 2.5ns, tf ≤ 2.5ns.

Applications Information

Logic Inputs

The logic control inputs can be driven up to +3.6V regardless of the supply voltage. For example, given a +3.3V supply, the output enables or select pins may be driven low to 0V and high to 3.6V. Driving IN Rail-to-Rail[®] minimizes power consumption.

Power-Supply Sequencing

Proper power-supply sequencing is advised for all CMOS devices. It is recommended to always apply VDD before applying signals to the input/output or control pins.

LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or

2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
