Description

Pericom Semiconductor's PI74VCX16244 buffer/driver is designed specifically to improve both the performance and density of 3-state memory address drivers, clock drivers, and bus-oriented receivers and transmitters.

The device can be used as four 4-bit buffers, two 8-bit buffers, or one 16-bit buffer. It provides true outputs and symmetrical active-low output-enable (\overline{OE}) inputs.

To ensure the high-impedance state during power up or power down, \overline{OE} should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

The PI74VCX family is I/O Tolerant, allowing it to operate in 1.8/3.6V systems.

- CL includes probe and jig capacitance.
 - Waveform 1 is for an output with internal conditions such that the output is LOW except when disabled by the output control.
- Waveform 2 is for an output with internal conditions such that the output is HIGH except when disabled by the output control.
- All input pulses are supplied by generators having the following characteristics: PRR ≤ 10 MHz, $Z_o = 50\Omega$, $t_r \leq 2$ ns, $t_f \leq 2$ ns, **measured from 10% to 90%, unless otherwise specified.**
