

## Description

The 74LVCH2T45 is a dual-bit, dual-supply transceiver with tri-state outputs suitable for transmitting two logic bits across different voltage domains. The direction pin (DIR) and Port A, consisting of pins 1A and 2A, have logic levels in relation to  $V_{CC}(A)$  while port B, consisting of pins 1B and 2B have logic levels related to  $V_{CC}(B)$ . This arrangement allows for universal low-voltage translation between any voltages from 1.2V to 5.5V. When a HIGH logic level is applied to the direction pin, port A pins become inputs and port B pins are outputs. Conversely, the roles of the ports are reversed when the direction pin is asserted LOW.

The tri-state (Ioff) feature places all port pins in a high impedance state when either power supply is at 0V, which prevents and damages backflow currents and provides power-down electrical isolation up to 5.5V as not to interfere with any logic activity on either of the ports.

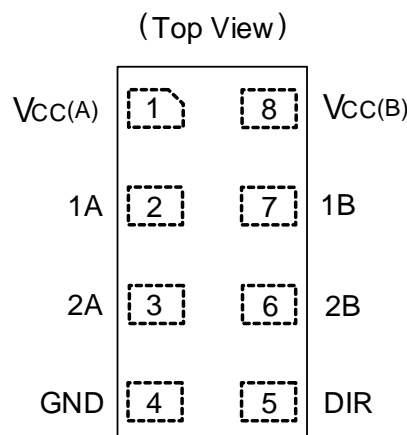

The 74LVCH2T45 is a variant of the 74LVC2T45 that includes a bus hold feature at each input. The bus hold feature maintains the previous logic level therefore a valid logic level is always present eliminating the need for additional resistors for unused or disconnected inputs.

- Notes:
- Includes test lead and test apparatus capacitance.
  - Waveform 1 is for an output with input set up as a low and device coming out or into 3-state via DIR control. Waveform 2 is for an output with input set up as a high and device coming out or into 3-state via DIR control.
  - All pulses are supplied at pulse repetition rate ≤ 10 MHz.
  - tPLZ and tPHZ are the same as tdis.
  - tPZL and tPZH are the same as tEN.
  - tPLH and tPHL are the same as tPD.
  - VCCI is the VCC associated with the input.
  - VCCO is the VCC associated with the output.
