Description

The PI6C48543 is a high-performance low-skew LVDS fanout buffer. PI6C48543 features two selectable differential inputs and translates to four LVDS outputs. The inputs can also be configured to single-ended with external resistor bias circuit. The CLK input accepts LPECL or LVDS or LVHSTL or SSTL or HCSL signals, and PCLK input accepts LVPECL or SSTL or CML signals. The outputs are synchronized with input clock during asynchronous assertion/deassertion of CLK_EN pin. PI6C48543 is ideal for differential to LVDS translations and/or LVDS clock distribution. Typical clock translation and distribution applications are data-communications and telecommunications.

Applications Information
Wiring the differential input to accept single ended levels
Figure 1 shows how the differential input can be wired to accept single ended levels. The reference voltage V_REF = V$_{DD}$/2 is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin. The ratio of R1 and R2 might need to be adjusted to postion the V_REF in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and V$_{DD}$ = 3.3V, V_REF should be 1.25V and R1/R2 = 0.609.
