Notes on Repetitive Avalanche Curves, Figures 15, 16: (For further info, see AN-1005 at www.irf.com)

- Avalanche failures assumption: Purely a thermal phenomenon and failure occurs at a temperature far in excess of T_{jmax}. This is validated for every part type.
- Safe operation in Avalanche is allowed as long asT_{jmax} is not exceeded.
- 3. Equation below based on circuit and waveforms shown in Figures 12a, 12b.
- P_{D (ave)} = Average power dissipation per single avalanche pulse.
- BV = Rated breakdown voltage (1.3 factor accounts for voltage increase during avalanche).
- 6. I_{av} = Allowable avalanche current.
- 7. ΔT = Allowable rise in junction temperature, not to exceed T_{jmax} (assumed as 25°C in Figure 15, 16). t_{av} = Average time in avalanche.
 - $D = Duty cycle in avalanche = t_{av} \cdot f$

 $Z_{th,JC}(D, t_{av})$ = Transient thermal resistance, see figure 11)

$$\begin{split} P_{D~(ave)} &= 1/2~(~1.3 \cdot BV \cdot I_{aV}) = \triangle T/~Z_{thJC} \\ I_{av} &= 2\triangle T/~[1.3 \cdot BV \cdot Z_{th}] \\ E_{AS~(AR)} &= P_{D~(ave)} \cdot t_{av} \end{split}$$
