

# 1.5 AMP HIGH VOLTAGE POSITIVE ADJUSTABLE REGULATOR

**Three Terminal, High Voltage, Precision Adjustable Positive Voltage Regulator In Hermetic JEDEC TO-257AA**

## FEATURES

- Similar To Industry Standard LT117AHV
- Adjustable Output Voltage
- Built In Thermal Overload Protection
- Short Circuit Current Limiting
- Available In Isolated and Non-Isolated Package
- Maximum Output Voltage Tolerance Is Guaranteed To  $\pm 1\%$
- Available Hi-Rel Screened

## DESCRIPTION

This three terminal positive regulator is supplied in a hermetically sealed metal package whose outline is similar to the industry standard TO-220 plastic package. All protective features are designed into the circuit, including thermal shutdown, current limiting, and safe-area control. With heat sinking, these devices can deliver up to 1.5 amps of output current. The unit also features output voltages that can be fixed from 1.2 volts to 57 volts using external resistors.

## ABSOLUTE MAXIMUM RATINGS @ 25°C

3.3

Power Dissipation ( $P_d$ ) (Internally Limited) .....	20 W
Input - Output Voltage Differential .....	60 V
Operating Junction Temperature Range .....	- 55°C to + 150°C
Storage Temperature Range .....	- 65°C to + 150°C
Lead Temperature (Soldering 10 seconds) .....	300°C
Thermal Resistance:	
$\alpha_{JC}$ (Isolated) .....	4.2°C/W
$\alpha_{JC}$ (Non-Isolated) .....	3.5°C/W
$\alpha_{JA}$ .....	42°C/W
Maximum Output Current .....	1.5 A

#### Notes:

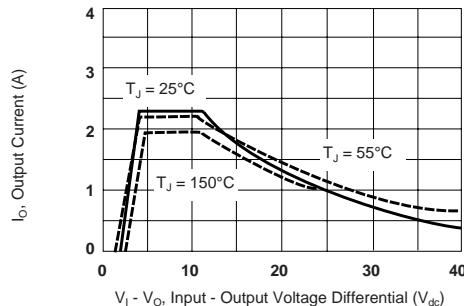

1. Load and Line Regulation are specified at a constant junction temperature. Pulse testing with low duty cycle is used. Changes in output voltage due to heating effects must be taken into account separately.
2. If not tested, shall be guaranteed to the specified limits.
3. The • denotes the specifications which apply over the full operating temperature range.

## TYPICAL APPLICATIONS

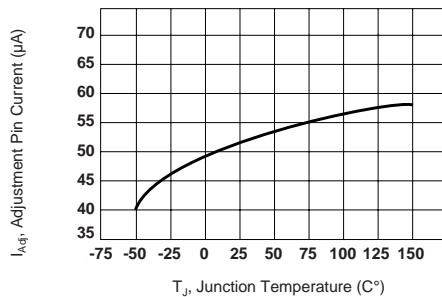

### LOAD REGULATION

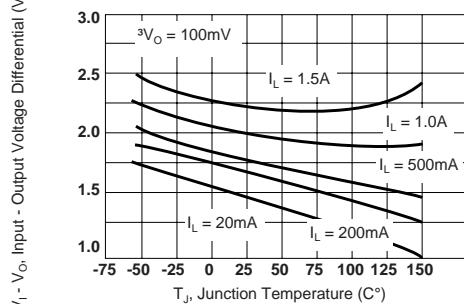

### CURRENT LIMIT

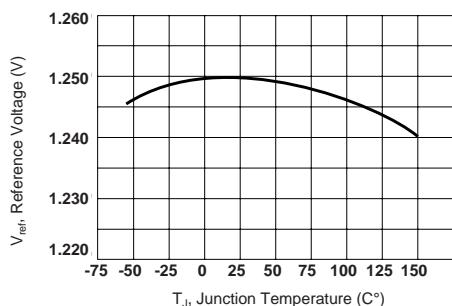

### ADJUSTMENT PIN CURRENT

### DROPOUT VOLTAGE

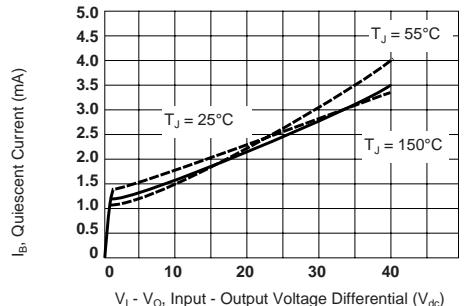

### TEMPERATURE STABILITY

3.3

### MINIMUM OPERATING CURRENT

### STANDARD APPLICATION

\*  $C_{\text{IN}}$  is required if regulator is located an appreciable distance from power supply filter.

\*\*  $C_o$  is not needed for stability, however it does improve transient response.

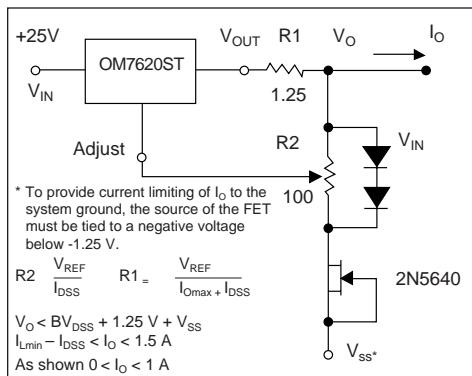

$$V_{\text{OUT}} = 1.25\text{ V} \left( 1 + \frac{R_2}{R_1} \right) + I_{\text{Adj}} R_2$$

Since  $I_{\text{Adj}}$  is controlled to less than  $100\ \mu\text{A}$ , the error associated with this term is negligible in most applications.
