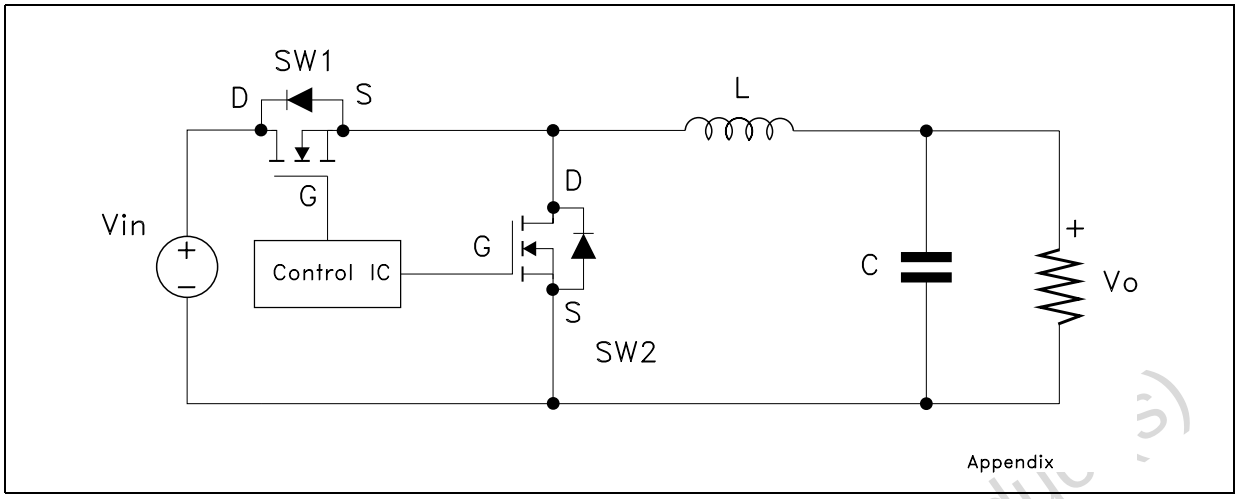
Appendix A Power losses estimation

Figure 19. Buck converter



The power losses associated with the FETs in a synchronous buck converter can be estimated using the equations shown in the table below. The formulas give a good approximation, for the sake of performance comparison, of how different pairs of devices affect the converter efficiency. However a very important parameter, the wotking temperature, is not considered. The real device behavior is really dependent on how the heat generated inside the devices is removed to allow for a safer working junction temperature.

The low side (SW2) device requires:

- Very low $R_{DS(on)}$ to reduce conduction losses
- Small Q_{gls} to reduce the gate charge losses
- Small C_{oss} to reduce losses due to output capacitance
- Small Q_{rr} to reduce losses on SW_1 during its turn-on
- The C_{gd}/C_{gs} ratio lower than V_{th}/V_{gg} ratio especially with low drain to source voltage to avoid the cross conduction phenomenon.

The high side (SW1) device requires:

- Small Rg and Lg to allow higher gate current peak and to limit the voltage feedback on the gate
- Small Q_g to have a faster commutation and to reduce gate charge losses
- Low $R_{DS(on)}$ to reduce the conduction losses

		High side switch (SW1)	Low side switch (SW2)
$P_{conduction}$		$R_{DS(on)} \bullet I_L^2 \bullet \delta$	$R_{DS(on)} \bullet I_L^2 \bullet (1-\delta)$
$P_{switching}$		$V_{in} \bullet (Q_{gsth(SW1)} + Q_{gd(SW1)}) \bullet f \bullet \frac{I_L}{I_g}$	Zero voltage switching
P_{diode}	Recovery	Not applicable	$^1V_{in} \bullet Q_{rr(SW2)} \bullet f$
	Conduction	Not applicable	$V_{f(SW2)} \bullet I_L \bullet t_{deadtime} \bullet f$
$P_{gate(Qg)}$		$Q_{g(SW1)} \bullet V_{gg} \bullet f$	$Q_{gls(SW2)} \bullet V_{gg} \bullet f$
