## DESCRIPTION

The TURBOSWITCH is a very high performance series of ultra-fast high voltage power diories. TURBOSWITCH family drastically cuts Iocses in both the diode and the associated ,witching IGBT and MOSFET in all freewhe? minúe operations and is particulary suitable enc tificient in motor

control freewheel applications and in booster diode applications in power factor control circuitries.
Available either in SMB or DO-15 axial package, these 600 V devices are particularly intended for use on 240 V domestic mains.

## APPLICATION DATA

The TURBOSWITCH ${ }^{\text {TM }}$ is especially designed to provide the lowest overall power losses in any "Freewhell Mode" application (see fig. A) considering both diode and companion transistor, thus optimizing the overall performance in the end application.

The way of calculating the power losses is given below:

Fig. A : "FREEWHEEL" MODE

## APPLICATION DATA (Cont'd)

Fig. B : STATIC CHARACTERISTICS

Fig. C : TURN-OFF CHARACTERISTICS

## Conduction losses:

$\mathrm{P} 1=\mathrm{V}_{\text {to }} \times \operatorname{IF}(\mathrm{AV})+\mathrm{R}_{\mathrm{d}} \times \mathrm{IF}^{2}(\mathrm{RMS})$

Reverse losses:
$P 2=V_{R} \times \operatorname{IR} \times(1-\delta)$

Turn-on losses:
(in the transistor, due to the diode)

$$
\begin{aligned}
P 5 & =\frac{V_{R} \times I_{R M} \times(3+2 \times S) \times F}{6 \times d I_{F} / d t} \\
& +\frac{V_{R} \times I_{R M} \times I_{L} \times(S+2) \times F}{2 \times d I_{F} / d t}
\end{aligned}
$$

Turn-off losses (in the diode) :

$$
\mathrm{P} 3=\frac{V_{R} \times I_{R M^{2}} \times S \times F}{6 \times d I_{F} / d t}
$$

P3 and P5 are suitable for power MOSFET and IGBT
