

## Single channel high-side driver with analog current sense for automotive applications

Datasheet - production data

### Features

Max transient supply voltage	$V_{CC}$	41 V
Operating voltage range	$V_{CC}$	4.5 to 28 V
Max on-state resistance (per ch.)	$R_{ON}$	6 m $\Omega$
Current limitation (typ)	$I_{LIMH}$	90 A
Off-state supply current	$I_S$	2 $\mu A^{(1)}$

1. Typical value with all loads connected.

- General
  - Very low standby current
  - 3.0 V CMOS compatible inputs
  - Optimized electromagnetic emissions
  - Very low electromagnetic susceptibility
  - Compliance with European directive 2002/95/EC
  - Very low current sense leakage
- Diagnostic functions
  - Proportional load current sense
  - High current sense precision for wide currents range
  - Diagnostic enable pin
  - Off-state open-load detection
  - Output short to  $V_{CC}$  detection
  - Overload and short to ground (power limitation) indication
  - Thermal shutdown indication
- Protection
  - Inrush current active management by power limitation

- Undervoltage shutdown
- Overvoltage clamp
- Load current limitation
- Self limiting of fast thermal transients
- Protection against loss of ground and loss of  $V_{CC}$
- Overtemperature shutdown with auto restart (thermal shutdown)
- Reverse battery protected with self switch of the Power MOSFET
- Electrostatic discharge protection

### Applications

- All types of resistive, inductive and capacitive loads

### Description

The VN5E006ASP-E is a single channel high-side driver manufactured using ST proprietary VIPower<sup>®</sup> M0-5 technology and housed in PowerSO-10 package. The device is designed to drive 12 V automotive grounded loads delivering protection, diagnostics. It also implements a 3 V and 5 V CMOS-compatible interface for use with any microcontroller.

The device integrates advanced protective functions such as load current limitation, inrush and overload active management by power limitation, overtemperature shut-off with auto-restart and overvoltage active clamp. A dedicated analog current sense pin is associated with every output channel providing enhanced diagnostic functions including fast detection of overload and short-circuit to ground through power limitation indication, over-temperature indication, short-circuit to  $V_{CC}$  diagnosis and on-state and off-state open-load detection. The current sensing and diagnostic feedback of the whole device can be disabled by pulling the DE pin low to share the external sense resistor with similar devices.

### 2.1 Absolute maximum ratings

Stressing the device above the ratings listed in [Table 3](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to the conditions in this section for extended periods may affect device reliability.

Table 3. Absolute maximum ratings

1. To ensure long term reliability under heavy overload or short circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device is subjected to abnormal conditions, this software must limit the duration and number of activation cycles.

### 3 Application information

Figure 32. Application schematic

#### 3.1 MCU I/Os protection

When negative transients are present on the  $V_{CC}$  line, the control pins are pulled negative to approximately -1.5V.

ST suggests the insertion of resistors ( $R_{prot}$ ) in the lines to prevent the microcontroller I/O pins from latching up.

The values of these resistors provide a compromise between the leakage current of the microcontroller, the current required by the HSD I/Os (input levels compatibility) and the latch-up limit of the microcontroller I/Os.

$$-V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH}) / I_{IHmax}$$

Calculation example:

For  $V_{CCpeak} = -1.5\text{ V}$  and  $I_{latchup} \geq 20\text{ mA}$ ;  $V_{OH\mu C} \geq 4.5\text{ V}$

$$75\ \Omega \leq R_{prot} \leq 240\text{ k}\Omega$$

Recommended values:  $R_{prot} = 10\text{ k}\Omega$ ,  $C_{EXT} = 10\text{ nF}$

#### 3.2 Load dump protection

$D_{id}$  is necessary (voltage transient suppressor) if the load dump peak voltage exceeds the  $V_{CCPK\ max}$  rating. The same applies if the device is subject to transients on the  $V_{CC}$  line that are greater than the ones shown in the ISO 7637-2: 2004(E) table.

### 3.3.1 Short to $V_{CC}$ and off-state open-load detection

Short to  $V_{CC}$

A short circuit between  $V_{CC}$  and output is indicated by the relevant current sense pin set to  $V_{SENSEH}$  during the device off state. Small or no current is delivered by the current sense during the on state depending on the nature of the short circuit.

OFF-state open-load with external circuitry

Detection of an open-load in off mode requires an external pull-up resistor  $R_{PU}$  connecting the output to a positive supply voltage  $V_{PU}$ .

It is preferable  $V_{PU}$  to be switched off during the module standby mode in order to avoid the overall standby current consumption to increase in normal conditions, i.e. when load is connected.

An external pull down resistor  $R_{PD}$  connected between output and GND is mandatory to avoid misdetection in case of floating outputs in off-state (see [Figure 33: Current sense and diagnostics](#)).

$R_{PD}$  must be selected in order to ensure  $V_{OUT} < V_{OLmin}$  unless pulled up by the external circuitry:

$$V_{OUT}|_{Pull-up\_OFF} = R_{PD} \cdot I_{L(off2)f} < V_{OLmin} = 2V$$

$R_{PD} \leq 22 \text{ K}\Omega$  is recommended.

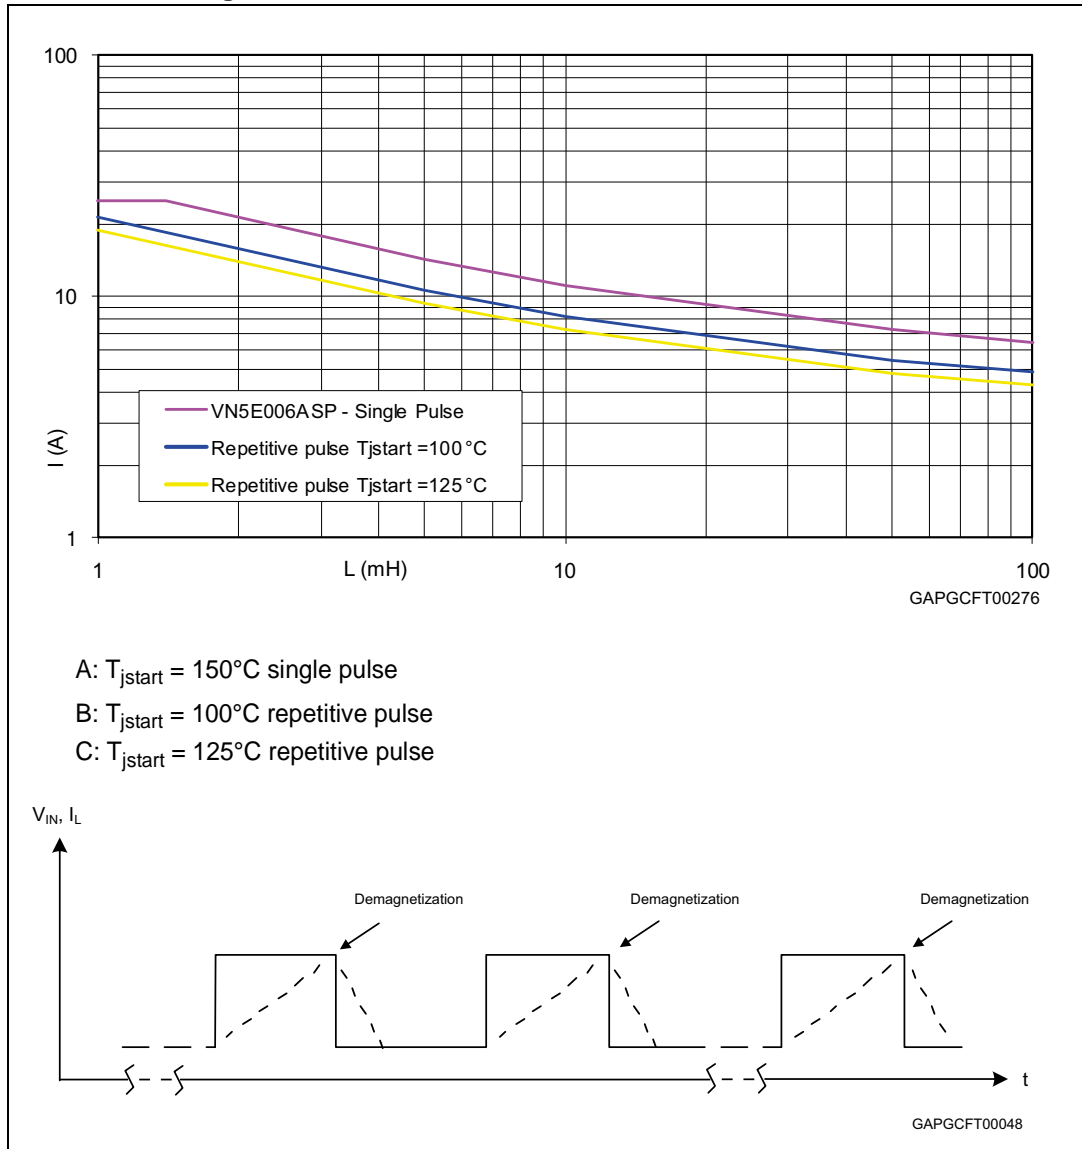

For proper open load detection in off state, the external pull-up resistor must be selected according to the following formula:

$$V_{OUT}|_{Pull-up\_ON} = \frac{R_{PD} \cdot V_{PU} - R_{PU} \cdot R_{PD} \cdot I_{L(off2)r}}{R_{PU} + R_{PD}} > V_{OLmax} = 4V$$

For the values of  $V_{OLmin}$ ,  $V_{OLmax}$ ,  $I_{L(off2)r}$  and  $I_{L(off2)f}$  see [Table 10: Open-load detection](#) ( $8 \text{ V} < V_{CC} < 18 \text{ V}$ ,  $V_{DE} = 5 \text{ V}$ ).

### 3.4 Maximum demagnetization energy ( $V_{CC} = 13.5\text{ V}$ )

Figure 34. Maximum turn-off current versus inductance

- A:  $T_{jstart} = 150^\circ\text{C}$  single pulse
- B:  $T_{jstart} = 100^\circ\text{C}$  repetitive pulse
- C:  $T_{jstart} = 125^\circ\text{C}$  repetitive pulse

Note: Values are generated with  $R_L = 0\ \Omega$ .  
 In case of repetitive pulses,  $T_{jstart}$  (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves A and B.
