

OMNIFETII fully autoprotected Power MOSFET

Datasheet - production data

Features

TYPE	$R_{DS(on)}$	I_{lim}	V_{clamp}
RVND14NV04	35 m Ω	12 A	40 V

- Linear current limitation
- Thermal shutdown
- Short circuit protection
- Integrated clamp
- Low current drawn from input pin
- Diagnostic feedback through input pin
- ESD protection
- Direct access to the gate of the Power MOSFET (analog driving)
 - Compatible with standard Power MOSFET
- Aerospace and Defense features
 - Dedicated traceability and part marking
 - Production parts approval documents available

- Adapted Extended life time and obsolescence management
- Extended Product Change Notification process
- Designed and manufactured to meet sub ppm quality goals
- Advanced mold and frame designs for Superior resilience to harsh environment (acceleration, EMI, thermal, humidity)
- Single Fabrication, Assembly and Test site
- Dual internal production source capability

Applications

- All types of resistive, inductive and capacitive loads in Aerospace and Defense applications.

Description

The RVND14NV04 is a monolithic device made using STMicroelectronics VIPower[®] M0-technology, intended for replacement of standard Power MOSFETS in DC to 50 KHz applications.

Built-in thermal shutdown, linear current limitation and overvoltage clamp protect the chip in harsh environments.

Fault feedback can be detected by monitoring the voltage at the input pin.

t_{dlim}	Step response current limit	$V_{IN} = 5\text{ V}; V_{DS} = 13\text{ V}$	-	45	-	μs
T_{jsh}	Over temperature shutdown	-	150	175	200	$^{\circ}\text{C}$
T_{jrs}	Over temperature reset	-	135	-	-	$^{\circ}\text{C}$
I_{gf}	Fault sink current	$V_{IN} = 5\text{ V}; V_{DS} = 13\text{ V}; T_j = T_{jsh}$	10	15	20	mA
E_{as}	Single pulse avalanche energy	Starting $T_j = 25\text{ }^{\circ}\text{C}; V_{DD} = 24\text{ V}; V_{IN} = 5\text{ V}; R_{gen} = R_{IN\text{ MIN}} = 10\ \Omega; L = 24\text{ mH}$ (see Figure 5 and Figure 6)	400	-	-	mJ

1. Pulsed: Pulse duration = 300 μs , duty cycle 1.5 %

3 Protection features

During normal operation, the input pin is electrically connected to the gate of the internal power MOSFET through a low impedance path.

The device then behaves like a standard power MOSFET and can be used as a switch from DC up to 50 kHz. The only difference from the user's standpoint is that a small DC current I_{ISS} (typ. 100 μ A) flows into the input pin in order to supply the internal circuitry.

The device integrates:

- Overvoltage clamp protection: internally set at 45 V, along with the rugged avalanche characteristics of the Power MOSFET stage give this device unrivalled ruggedness and energy handling capability. This feature is mainly important when driving inductive loads.
- Linear current limiter circuit: limits the drain current I_D to I_{lim} whatever the input pin voltages. When the current limiter is active, the device operates in the linear region, so power dissipation may exceed the capability of the heatsink. Both case and junction temperatures increase, and if this phase lasts long enough, junction temperature may reach the over temperature threshold T_{jsh} .
- Over temperature and short circuit protection: these are based on sensing the chip temperature and are not dependent on the input voltage. The location of the sensing element on the chip in the power stage area ensures fast, accurate detection of the junction temperature. Over temperature cutout occurs in the range 150 to 190 °C, a typical value being 170 °C. The device is automatically restarted when the chip temperature falls of about 15 °C below shutdown temperature.
- Status feedback: in the case of an over temperature fault condition ($T_j > T_{jsh}$), the device tries to sink a diagnostic current I_{gf} through the input pin in order to indicate fault condition. If driven from a low impedance source, this current may be used in order to warn the control circuit of a device shutdown. If the drive impedance is high enough so that the input pin driver is not able to supply the current I_{gf} , the input pin will fall to 0 V. This will not however affect the device operation: no requirement is put on the current capability of the input pin driver except to be able to supply the normal operation drive current I_{ISS} .

Additional features of this device are ESD protection according to the Human Body model and the ability to be driven from a TTL Logic circuit.
