## 200 mA, Output Capacitor Free, LDO Linear Voltage Regulator

The NCP4588 is a CMOS 200mA LDO which is stable without an output capacitor. This results in a reduction in component count, cost and board area, as well as contributing to a more robust solution in hostile environments. With quiescent current  $< 9.5 \mu\text{A}$  and PSRR  $> 60 \text{ dB}$ , the device is an excellent trade off between the two features. The family is available in a variety of packages: SC-70, SOT23 and a small, ultra thin  $1.2 \times 1.2 \times 0.4 \text{ mm}$  XDFN.

### Features

- Operating Input Voltage Range: 1.4 V to 5.25 V
- Output Voltage Range: 1.0 to 4.2 V (available in 0.1 V steps)
- Output Voltage Accuracy: 1%
- Quiescent Current:  $9.5 \mu\text{A}$
- Standby Current:  $0.1 \mu\text{A}$
- Very Low Dropout: 270 mV ( $I_{\text{OUT}} = 200 \text{ mA}$ ,  $V_{\text{IN}} = 3.0 \text{ V}$ )
- High PSRR: 70 dB at 1 kHz,  $V_{\text{OUT}} \leq 1.2 \text{ V}$   
65 dB at 1 kHz,  $1.2 < V_{\text{OUT}} < 2.2 \text{ V}$   
60 dB at 1 kHz,  $V_{\text{OUT}} \geq 2.2 \text{ V}$
- Line Regulation 0.02%/V Typ.
- Current Fold Back Protection: 50 mA at short
- Stable with no Output Capacitor
- Available in SC-70, XDFN and SOT23 Package
- These are Pb-Free Devices

### Typical Applications

- Battery Powered Equipments
- Portable Communication Equipments
- Cameras, VCRs and Camcorders

## PIN FUNCTION DESCRIPTION

Pin No. XDFN	Pin No. SC-70	Pin No. SOT23	Pin Name	Description
4	5	1	VIN	Input pin
2	3	2	GND	Ground
3	1	3	CE	Chip enable pin (Active "H")
6	4	5	VOUT	Output pin
1, 5	2	4	NC	No connection

## ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage (Note 1)	$V_{IN}$	6.0	V
Output Voltage	$V_{OUT}$	-0.3 to $V_{IN} + 0.3$	V
Chip Enable Input	$V_{CE}$	-0.3 to 6.0	V
Output Current	$I_{OUT}$	400	mA
Power Dissipation XDFN	$P_D$	400	mW
Power Dissipation SC70		380	
Power Dissipation SOT23		420	
Junction Temperature	$T_J$	-40 to 150	°C
Storage Temperature	$T_{STG}$	-55 to 125	°C
ESD Capability, Human Body Model (Note 2)	$ESD_{HBM}$	2000	V
ESD Capability, Machine Model (Note 2)	$ESD_{MM}$	200	V

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
2. This device series incorporates ESD protection and is tested by the following methods:  
 ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114)  
 ESD Machine Model tested per AEC-Q100-003 (EIA/JESD22-A115)  
 Latchup Current Maximum Rating tested per JEDEC standard: JESD78.

APPLICATION INFORMATION

A typical application circuit for NCP4588 series is shown in Figure 45.

Figure 45. Typical Application Schematic

Input Decoupling Capacitor (C1)

A 100 nF ceramic input decoupling capacitor should be connected as close as possible to the input and ground pin of the NCP4588. Higher values and lower ESR improves line transient response.

Output Decoupling Capacitor (C2)

The output capacitor may be not used even if the load current is varied, but if load variation is very large it is better to use an output capacitor in the range of 0.1  $\mu$ F to 10  $\mu$ F. It is recommended to use ceramic capacitor; tantalum capacitor with higher ESR may cause unstable output.

Enable Operation

The enable pin CE may be used for turning the regulator on and off. The regulator is switched on when the CE pin

voltage is above logic high level. The enable pin has internal pull down current source. If enable function is not needed connect CE pin to VIN.

Output Discharger

The D version includes a transistor between VOUT and GND that is used for faster discharging of the output capacitor. This function is activated when the IC goes into disable mode.

Thermal

As power across the IC increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and also the ambient temperature affect the rate of temperature rise for the part. That is to say, when the device has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power dissipation applications.

PCB layout

Make VIN and GND line sufficient. If their impedance is high, noise pickup or unstable operation may result. Connect capacitors C1 and C2 (if it is used) as close as possible to the IC, and make wiring as short as possible.
