APPLICATION INFORMATION

Input Decoupling

A 1.0 μF ceramic capacitor is the recommended value to be connected between V_{in} and GND. For PCB layout considerations, the traces of V_{in} and GND should be sufficiently wide in order to minimize noise and prevent unstable operation.

Output Decoupling

It is best to use a 1.0 μF capacitor value when $V_{\text{out}} < 2.5\text{ V}$ and a 0.47 μF when $V_{\text{out}} \geq 2.5\text{ V}$. For better

performance, select a capacitor with low Equivalent Series Resistance (ESR). For PCB layout considerations, place the output capacitor close to the output pin and keep the leads as short as possible.

Noise Decoupling

The NCP582 series are low noise regulators and reach a noise level of only 30 μV_{rms} between 10 Hz and 100 kHz.
