

Low-power dual voltage comparator

Datasheet – production data

Features

- Wide single supply voltage range or dual supplies +2 V to +36 V or ± 1 V to ± 18 V
- Very low supply current (0.4 mA) independent of supply voltage (1 mW/comparator at +5 V)
- Low input bias current: 25 nA typ.
- Low input offset current: ± 5 nA typ.
- Input common-mode voltage range includes ground
- Low output saturation voltage: 250 mV typ. ($I_O = 4$ mA)
- Differential input voltage range equal to the supply voltage
- TTL, DTL, ECL, MOS, CMOS compatible outputs

Description

This device consists of two independent low power voltage comparators designed specifically to operate from a single supply over a wide range of voltages. Operation from split power supplies is also possible.

These comparators also have a unique characteristic in that the input common-mode voltage range includes ground even though operated from a single power supply voltage.

1 Absolute maximum ratings and operating conditions

Table 1. Absolute maximum ratings (AMR)

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage	± 18 or 36	V
V_{id}	Differential input voltage	± 36	V
V_{in}	Input voltage	-0.3 to +36	V
	Output short-circuit to ground ⁽¹⁾	20	mA
R_{thja}	Thermal resistance junction to ambient ⁽²⁾ (SO-8)	125	°C/W
R_{thjc}	Thermal resistance junction to case ⁽²⁾ (SO-8)	40	°C/W
T_j	Maximum junction temperature	160	°C
ESD	HBM: human body model ⁽³⁾	800	V
	MM: machine model ⁽⁴⁾	200	
	CDM: charged device model ⁽⁵⁾	1500	
T_{stg}	Storage temperature range	-65 to +150	°C

- Short-circuit from the output to V_{CC}^+ can cause excessive heating and eventual destruction. The maximum output current is approximately 20 mA, independent of the magnitude of V_{CC}^+ .
- Short-circuits can cause excessive heating and destructive dissipation. Values are typical.
- Human body model: A 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 kΩ resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
- Machine model: A 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω). This is done for all couples of connected pin combinations while the other pins are floating.
- Charged device model: all pins and the package are charged together to the specified voltage and then discharged directly to the ground through only one pin. This is done for all pins.

Table 2. Operating conditions

Symbol	Parameter	Value	Unit
V_{CC}^+	Supply voltage	2 to 36	V
T_{oper}	Operating free-air temperature range	-40 to +150	°C
V_{icm}	Input common mode voltage range ($V_{CC} = 30$ V) ⁽¹⁾ $T_{amb} = +25^\circ\text{C}$ $T_{min} \leq T_{amb} \leq T_{max}$	0 to $V_{CC}^+ - 1.5$ 0 to $V_{CC}^+ - 2$	V

- The input common-mode voltage of either input signal voltage should not be allowed to go negative by more than 0.3 V. The upper end of the common-mode voltage range is $V_{CC}^+ - 1.5$ V, but either or both inputs can go to +30 V without damage.

I_{OH}	High level output current ($V_{CC}^+ = V_o = 30V, V_{id} = 1V$) $T_{min} \leq T_{amb} \leq T_{max}$		0.1	1	nA μA
I_{sink}	Output sink current ($V_{id} = -1V, V_o = 1.5V$) $T_{min} \leq T_{amb} \leq T_{max}$	6 2	16		mA
t_{re}	Small signal response time ⁽⁴⁾ ($R_L = 5.1k\Omega$ to V_{CC}^+)		1.3		μs
t_{rel}	Large signal response time ⁽⁵⁾ TTL input ($V_{ref} = +1.4V, R_L = 5.1k\Omega$ to V_{CC}^+) Output signal at 50% of final value Output signal at 95% of final value			500 1	ns μs

1. At output switch point, $V_o \approx 1.4V$, $R_S = 0\Omega$ with V_{CC}^+ from 5V to 30V, and over the full input common-mode range (0V to $V_{CC}^+ - 1.5V$).
2. The direction of the input current is out of the IC due to the PNP input stage. This current is essentially constant, independent of the state of the output, so there is no load charge on the reference of input lines.
3. Positive excursions of input voltage may exceed the power supply level. As long as the other voltage remains within the common-mode range, the comparator will provide a proper output state.
The low input voltage state must not be less than $-0.3V$ (or $0.3V$ below the negative power supply, if used)
4. The response time specified is for a 100 mV input step with 5 mV overdrive.
5. Maximum values are guaranteed by design and evaluation.
