## 2336 (H) x 1752 (V) Interline CCD Image Sensor

### Description

The KAI-04050 Image Sensor is a 4-megapixel CCD in a 1" optical format. Based on the TRUESENSE 5.5 micron Interline Transfer CCD Platform, the sensor features broad dynamic range, excellent imaging performance, and a flexible readout architecture that enables use of 1, 2, or 4 outputs. The sensor supports full resolution readout up to 32 frames per second, while a Region of Interest (ROI) mode enables partial readout of the sensor at even higher frame rates. A vertical overflow drain structure suppresses image blooming and enables electronic shuttering for precise exposure control.

Table 1. GENERAL SPECIFICATIONS

Parameter	Typical Value
Architecture	Interline CCD, Progressive Scan
Total Number of Pixels	2404 (H) × 1800 (V)
Number of Effective Pixels	2360 (H) × 1776 (V)
Number of Active Pixels	2336 (H) × 1752 (V)
Pixel Size	5.5 μm (H) × 5.5 μm (V)
Active Image Size	12.85 mm (H) × 9.64 mm (V), 16.06 mm (Diagonal), 1" Optical Format
Aspect Ratio	4:3
Number of Outputs	1, 2, or 4
Charge Capacity	20,000 electrons
Output Sensitivity	34 μV/e <sup>-</sup>
Quantum Efficiency Pan (-ABA, -QBA, -PBA) R, G, B (-FBA, -QBA) R, G, B (-CBA, -PBA)	44% 31%, 37%, 38% 29%, 37%, 39%
Read Noise (f = 40 MHz)	12 e <sup>-</sup> rms
Dark Current Photodiode VCCD	7 e <sup>-</sup> /s 100 e <sup>-</sup> /s
Dark Current Doubling Temp. Photodiode VCCD	7°C 9°C
Dynamic Range	64 dB
Charge Transfer Efficiency	0.999999
Blooming Suppression	> 300 X
Smear	-100 dB
Image Lag	< 10 electrons
Maximum Pixel Clock Speed	40 MHz
Maximum Frame Rate Quad Output Dual Output Single Output	32 fps 16 fps 8 fps
Package	68 Pin PGA
Cover Glass	AR Coated, 2 Sides or Clear Glass

NOTE: All Parameters are specified at T = 40°C unless otherwise noted.

Figure 1. KAI-04050 Interline CCD Image Sensor

### Features

- Bayer Color Pattern, TRUESENSE Sparse Color Filter Pattern, and Monochrome Configurations
- Progressive Scan Readout
- Flexible Readout Architecture
- High Frame Rate
- High Sensitivity
- Low Noise Architecture
- Excellent Smear Performance
- Package Pin Reserved for Device Identification

### Application

- Industrial Imaging
- Medical Imaging
- Security

### ORDERING INFORMATION

See detailed ordering and shipping information on page 2 of this data sheet.

## KAI-04050

The sensor is available with the TRUESENSE Sparse Color Filter Pattern, a technology which provides a 2x improvement in light sensitivity compared to a standard color Bayer part.

The sensor shares common pin-out and electrical configurations with other devices based on the

TRUESENSE 5.5 micron Interline Transfer CCD Platform, allowing a single camera design to support multiple members of this sensor family.

### ORDERING INFORMATION

**Table 2. ORDERING INFORMATION – KAI-04050 IMAGE SENSOR**

Part Number	Description	Marking Code
KAI-04050-AAA-JP-BA	Monochrome, No Microlens, PGA Package, Taped Clear Cover Glass, No Coatings, Standard Grade	KAI-04050-AAA Serial Number
KAI-04050-AAA-JP-AE	Monochrome, No Microlens, PGA Package, Taped Clear Cover Glass, No Coatings, Engineering Grade	
KAI-04050-ABA-JD-BA	Monochrome, Telecentric Microlens, PGA Package, Sealed Clear Cover Glass with AR Coating (Both Sides), Standard Grade	KAI-04050-ABA Serial Number

\*Not recommended for new designs.

See the ON Semiconductor *Device Nomenclature* document (TND310/D) for a full description of the naming convention used for image sensors. For reference documentation, including information on evaluation kits, please visit our web site at [www.onsemi.com](http://www.onsemi.com).

DEVICE DESCRIPTION

Architecture

Figure 2. Block Diagram

**Dark Reference Pixels**

There are 12 dark reference rows at the top and 12 dark rows at the bottom of the image sensor. The dark rows are not entirely dark and so should not be used for a dark reference level. Use the 22 dark columns on the left or right side of the image sensor as a dark reference.

Under normal circumstances use only the center 20 columns of the 22 column dark reference due to potential light leakage.

**Dummy Pixels**

Within each horizontal shift register there are 11 leading additional shift phases. These pixels are designated as dummy pixels and should not be used to determine a dark reference level.

In addition, there is one dummy row of pixels at the top and bottom of the image.

**Active Buffer Pixels**

12 unshielded pixels adjacent to any leading or trailing dark reference regions are classified as active buffer pixels.

These pixels are light sensitive but are not tested for defects and non-uniformities.

**Image Acquisition**

An electronic representation of an image is formed when incident photons falling on the sensor plane create electron-hole pairs within the individual silicon photodiodes. These photoelectrons are collected locally by the formation of potential wells at each photosite. Below photodiode saturation, the number of photoelectrons collected at each pixel is linearly dependent upon light level and exposure time and non-linearly dependent on wavelength. When the photodiodes charge capacity is reached, excess electrons are discharged into the substrate to prevent blooming.

**ESD Protection**

Adherence to the power-up and power-down sequence is critical. Failure to follow the proper power-up and power-down sequences may cause damage to the sensor. See Power-Up and Power-Down Sequence section.

1. Per color.
2. Value is over the range of 10% to 90% of linear signal level saturation.
3. The operating value of the substrate voltage, V<sub>AB</sub>, will be marked on the shipping container for each device. The value of V<sub>AB</sub> is set such that the photodiode charge capacity is 680 mV.
4. At 40 MHz.
5. Uses 20LOG (P<sub>Ne</sub> / n<sub>e-T</sub>).
6. Assumes 5 pF load.
7. This color filter set configuration (Gen1) is not recommended for new designs.

Column Defect	A group of more than 10 contiguous major defective pixels along a single column.	0	0	2

1. For the color device (KAI-04050-FBA, KAI-04050-CBA, KAI-04050-QBA, or KAI-04050-PBA), a bright field defective pixel deviates by 12% with respect to pixels of the same color.
2. Column and cluster defects are separated by no less than two (2) good pixels in any direction (excluding single pixel defects).

## Defect Map

The defect map supplied with each sensor is based upon testing at an ambient (27°C) temperature. Minor point

defects are not included in the defect map. All defective pixels are reference to pixel 1, 1 in the defect maps. See Figure 14 for the location of pixel 1, 1.

**TEST DEFINITIONS**

**Test Regions of Interest**

Image Area ROI: Pixel (1, 1) to Pixel (2360, 1776)  
 Active Area ROI: Pixel (13, 13) to Pixel (2348, 1764)  
 Center ROI: Pixel (1131, 839) to Pixel (1230, 938)

Only the Active Area ROI pixels are used for performance and defect tests.

**Overclocking**

The test system timing is configured such that the sensor is overclocked in both the vertical and horizontal directions. See Figure 14 for a pictorial representation of the regions of interest.

**Figure 14. Regions of Interest**

**Tests**

*Dark Field Global Non-Uniformity*

This test is performed under dark field conditions. The sensor is partitioned into 192 sub regions of interest, each of which is 146 by 146 pixels in size. (See Figure 15: Test Sub Regions of Interest.) The average signal level of each of the 192 sub regions of interest is calculated. The signal level of each of the sub regions of interest is calculated using the following formula:

$$\text{Signal of ROI}[i] = (\text{ROI Average in Counts} - \text{Horizontal Overclock Average in Counts}) \cdot \text{mV per Count}$$

Units : mVpp (millivolts Peak to Peak)

where i = 1 to 192. During this calculation on the 192 sub regions of interest, the maximum and minimum signal levels

are found. The dark field global uniformity is then calculated as the maximum signal found minus the minimum signal level found.

*Global Non-Uniformity*

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 476 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. Global non-uniformity is defined as

$$\text{Global Non-Uniformity} = 100 \cdot \left( \frac{\text{Active Area Standard Deviation}}{\text{Active Area Signal}} \right)$$

Units : % rms

Active Area Signal = Active Area Average – Dark Column Average

*Global Peak to Peak Non-Uniformity*

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 476 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. The sensor is partitioned into 192 sub regions of interest, each of which is 146 by 146 pixels in size. (See Figure 15: Test Sub Regions of Interest.) The average signal level of each of the 192 sub regions of interest (ROI) is calculated. The signal level of each of the sub regions of interest is calculated using the following formula:

$$\text{Signal of ROI}[i] = (\text{ROI Average in Counts} - \text{Horizontal Overclock Average in Counts}) \cdot \text{mV per Count}$$

Where i = 1 to 192. During this calculation on the 192 sub regions of interest, the maximum and minimum signal levels are found. The global peak to peak uniformity is then calculated as:

$$\text{Global Uniformity} = 100 \cdot \left( \frac{\text{Max. Signal} - \text{Min. Signal}}{\text{Active Area Signal}} \right)$$

Units : % pp

*Center Non-Uniformity*

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 476 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. Defects are excluded for the calculation of this test. This test is performed on the center 100 by 100 pixels of the sensor. Center uniformity is defined as:

$$\text{Center ROI Uniformity} = 100 \cdot \left( \frac{\text{Center ROI Standard Deviation}}{\text{Center ROI Signal}} \right)$$

Units : % rms

Center ROI Signal = Center ROI Average - Dark Colum Average

*Dark Field Defect Test*

This test is performed under dark field conditions. The sensor is partitioned into 192 sub regions of interest, each of which is 146 by 146 pixels in size. In each region of interest, the median value of all pixels is found. For each region of interest, a pixel is marked defective if it is greater than or equal to the median value of that region of interest plus the defect threshold specified in the “Detect Definitions” section.

*Bright Field Defect Test*

This test is performed with the imager illuminated to a level such that the output is at approximately 476 mV. Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. The average signal level of all active pixels is found. The bright and dark thresholds are set as:

$$\text{Dark Defect Threshold} = \text{Active Area Signal} \cdot \text{Threshold}$$

$$\text{Bright Defect Threshold} = \text{Active Area Signal} \cdot \text{Threshold}$$

The sensor is then partitioned into 192 sub regions of interest, each of which is 146 by 146 pixels in size. In each region of interest, the average value of all pixels is found. For each region of interest, a pixel is marked defective if it is greater than or equal to the median value of that region of interest plus the bright threshold specified or if it is less than or equal to the median value of that region of interest minus the dark threshold specified.

Example for major bright field defective pixels:

- Average value of all active pixels is found to be 476 mV
- Dark defect threshold: 476 mV · 12% = 57 mV
- Bright defect threshold: 476 mV · 12% = 57 mV
- Region of interest #1 selected. This region of interest is pixels 13, 13 to pixels 158, 158
  - ♦ Median of this region of interest is found to be 470 mV
  - ♦ Any pixel in this region of interest that is ≥ (470 + 57 mV) 527 mV in intensity will be marked defective
  - ♦ Any pixel in this region of interest that is ≤ (470 - 57 mV) 413 mV in intensity will be marked defective
- All remaining 192 sub regions of interest are analyzed for defective pixels in the same manner

**OPERATION**

**Absolute Maximum Ratings**

Absolute maximum rating is defined as a level or condition that should not be exceeded at any time per the

description. If the level or the condition is exceeded, the device will be degraded and may be damaged. Operation at these values will reduce MTTF.

**Table 10. ABSOLUTE MAXIMUM RATINGS**

Description	Symbol	Minimum	Maximum	Unit	Notes
Operating Temperature	T <sub>OP</sub>	-50	70	°C	1
Humidity	RH	5	90	%	2
Output Bias Current	I <sub>OUT</sub>	-	60	mA	3
Off-Chip Load	C <sub>L</sub>	-	10	pF	

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- Noise performance will degrade at higher temperatures.
- T = 25°C. Excessive humidity will degrade MTTF.
- Total for all outputs. Maximum current is -15 mA for each output. Avoid shorting output pins to ground or any low impedance source during operation. Amplifier bandwidth increases at higher current and lower load capacitance at the expense of reduced gain (sensitivity).

**Table 11. ABSOLUTE MAXIMUM VOLTAGE RATINGS BETWEEN PINS AND GROUND**

Description	Minimum	Maximum	Unit	Notes
VDD <sub>α</sub> , VOUT <sub>α</sub>	-0.4	17.5	V	1
RD <sub>α</sub>	-0.4	15.5	V	1
V1B, V1T	ESD - 0.4	ESD + 24.0	V	
V2B, V2T, V3B, V3T, V4B, V4T	ESD - 0.4	ESD + 14.0	V	
H1S <sub>α</sub> , H1B <sub>α</sub> , H2S <sub>α</sub> , H2B <sub>α</sub> , H2SL <sub>α</sub> , R <sub>α</sub> , OG <sub>α</sub>	ESD - 0.4	ESD + 14.0	V	1
ESD	-10.0	0.0	V	
SUB	-0.4	40.0	V	2

- α denotes a, b, c or d.
- Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions*

**Power-Up and Power-Down Sequence**

Adherence to the power-up and power-down sequence is critical. Failure to follow the proper power-up and power-down sequences may cause damage to the sensor.

Notes:

1. Activate all other biases when ESD is stable and SUB is above 3 V.
2. Do not pulse the electronic shutter until ESD is stable.
3. VDD cannot be +15 V when SUB is 0 V.
4. The image sensor can be protected from an accidental improper ESD voltage by current limiting the SUB current to less than 10 mA. SUB and VDD must always be greater than GND. ESD must always be less than GND. Placing diodes between SUB, VDD, ESD and ground will protect the sensor from accidental overshoots of SUB, VDD and ESD during power on and power off. See the figure below.

**Figure 16. Power-Up and Power-Down Sequence**

The VCCD clock waveform must not have a negative overshoot more than 0.4 V below the ESD voltage.

**Figure 17. VCCD Clock Waveform**

Example of external diode protection for SUB, VDD and ESD.  $\alpha$  denotes a, b, c or d.

**Figure 18. Example of External Diode Protection**

DC Bias Operating Conditions

Table 12. DC BIAS OPERATING CONDITIONS

Description	Pins	Symbol	Min.	Nom.	Max.	Unit	Max. DC Current	Notes
Reset Drain	RD $\alpha$	RD	11.8	12.0	12.2	V	10 $\mu$ A	1
Output Gate	OG $\alpha$	OG	-2.2	-2.0	-1.8	V	10 $\mu$ A	1
Output Amplifier Supply	VDD $\alpha$	V <sub>DD</sub>	14.5	15.0	15.5	V	11.0 mA	1, 2
Ground	GND	GND	0.0	0.0	0.0	V	-1.0 mA	
Substrate	SUB	V <sub>SUB</sub>	5.0	V <sub>AB</sub>	V <sub>DD</sub>	V	50 $\mu$ A	3, 8
ESD Protection Disable	ESD	ESD	-9.5	-9.0	V <sub>X_L</sub>	V	50 $\mu$ A	6, 7, 9
Output Bias Current	VOU $\alpha$	I <sub>OUT</sub>	-3.0	-7.0	-10.0	mA	-	1, 4, 5

- $\alpha$  denotes a, b, c or d.
- The maximum DC current is for one output.  $I_{DD} = I_{OUT} + I_{SS}$ . See Figure 19.
- The operating value of the substrate voltage,  $V_{AB}$ , will be marked on the shipping container for each device. The value of  $V_{AB}$  is set such that the photodiode charge capacity is the nominal  $P_{Ne}$  (see Specifications).
- An output load sink must be applied to each VOUT pin to activate each output amplifier.
- Nominal value required for 40 MHz operation per output. May be reduced for slower data rates and lower noise.
- Adherence to the power-up and power-down sequence is critical. See Power-Up and Power-Down Sequence section.
- ESD maximum value must be less than or equal to  $V1\_L + 0.4$  V and  $V2\_L + 0.4$  V.
- Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions*.
- Where  $Vx\_L$  is the level set for  $V1\_L$ ,  $V2\_L$ ,  $V3\_L$ , or  $V4\_L$  in the application.

Figure 19. Output Amplifier

AC Operating Conditions

Table 13. CLOCK LEVELS

Description	Pins <sup>1</sup>	Symbol	Level	Min.	Nom.	Max.	Units	Capacitance <sup>2</sup>
Vertical CCD Clock, Phase 1	V1B, V1T	V1_L	Low	-8.2	-8.0	-7.8	V	21 nF (Note 6)
		V1_M	Mid	-0.2	0.0	0.2		
		V1_H	High	11.5	12.0	12.5

		V3_H	High	-0.2	0.0	0.2		
Vertical CCD Clock, Phase 4	V4B, V4T	V4_L	Low	-8.2	-8.0	-7.8	V	21 nF (6)
		V4_H	High	-0.2	0.0	0.2		
Horizontal CCD Clock, Phase 1 Storage	H1S $\alpha$	H1S_L	Low	-5.2 (7)	-4.0	-3.8	V	200 pF (6)
		H1S_A	Amplitude	3.8	4.0	5.2 (7)		
Horizontal CCD Clock, Phase 1 Barrier	H1B $\alpha$	H1B_L	Low	-5.2 (7)	-4.0	-3.8	V	130 pF (6)
		H1B_A	Amplitude	3.8	4.0	5.2 (7)		
Horizontal CCD Clock, Phase 2 Storage	H2S $\alpha$	H2S_L	Low	-5.2 (7)	-4.0	-3.8	V	200 pF (6)
		H2S_A	Amplitude	3.8	4.0	5.2 (7)		
Horizontal CCD Clock, Phase 2 Barrier	H2B $\alpha$	H2B_L	Low	-5.2 (7)	-4.0	-3.8	V	130 pF (6)
		H2B_A	Amplitude	3.8	4.0	5.2 (7)		
Horizontal CCD Clock, Last Phase (Note 3)	H2SL $\alpha$	H2SL_L	Low	-5.2	-5.0	-4.8	V	20 pF (6)
		H2SL_A	Amplitude	4.8	5.0	5.2		
Reset Gate	R1 $\alpha$	R_L (4)	Low	-3.5	-2.0	-1.5	V	16 pF (6)
		R_A	Amplitude	2.5	3.0	4.0		
Electronic Shutter (Note 5)	SUB	VES	High	29.0	30.0	40.0	V	1400 pF (6)

- $\alpha$  denotes a, b, c or d.
- Capacitance is total for all like named pins.
- Use separate clock driver for improved speed performance.
- Reset low should be set to -3 V for signal levels greater than 40,000 electrons.
- Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions*.
- Capacitance values are estimated.
- If the minimum horizontal clock low level is used (-5.2 V), then the maximum horizontal clock amplitude should be used (5.2 V amplitude) to create a -5.2 V to 0.0 V clock. If a 5 volt clock driver is used, the horizontal low level should be set to -5.0 V and the high level should be a set to 0.0 V.

The figure below shows the DC bias (VSUB) and AC clock (VES) applied to the SUB pin. Both the DC bias and AC clock are referenced to ground.

Figure 20. DC Bias and AC Clock Applied to the SUB Pin

# KAI-04050

## Device Identification

The device identification pin (DevID) may be used to determine which Truesense Imaging 5.5 micron pixel interline CCD sensor is being used.

**Table 14. DEVICE IDENTIFICATION**

Description	Pins	Symbol	Min.	Nom.	Max.	Unit	Max. DC Current	Notes
Device Identification	DevID	DevID	20,000	25,000	30,000	$\Omega$	50 $\mu$ A	1, 2, 3

1. Nominal value subject to verification and/or change during release of preliminary specifications.
2. If the Device Identification is not used, it may be left disconnected.
3. Values specified are for 40°C.

## Recommended Circuit

Note that V1 must be a different value than V2.

**Figure 21. Device Identification Recommended Circuit**

Rd	P7	P7 (Note 1) or Off (Note 3)	P7 (Note 1) or Off (Note 3)	P7 (Note 1) or Off (Note 3)

#Lines/Frame (Minimum)	900	1800	900	1800
#Pixels/Line (Minimum)	1213		2426	

1. For optimal performance of the sensor. May be clocked at a lower frequency. If clocked at a lower frequency, the frequency selected should be a multiple of the frequency used on the a and b register.
2. H2SLx follows the same pattern as H2Sx. For optimal speed performance, use a separate clock driver.
3. Off = +5 V. Note that there may be operating conditions (high temperature and/or very bright light sources) that will cause blooming from the unused c/d register into the image area.

**Photodiode Transfer Timing**

A row of charge is transferred to the HCCD on the falling edge of V1 as indicated in the P1 pattern below. Using this timing sequence, the leading dummy row or line is combined with the first dark row in the HCCD. The “Last Line” is dependent on readout mode – either 632 or 1264 minimum counts required. It is important to note that, in

general, the rising edge of a vertical clock (patterns P1–P4) should be coincident or slightly leading a falling edge at the same time interval. This is particularly true at the point where P1 returns from the high (3<sup>rd</sup> level) state to the mid-state when P4 transitions from the low state to the high state.

**Figure 22. Photodiode Transfer Timing**

**Line and Pixel Timing**

Each row of charge is transferred to the output, as illustrated below, on the falling edge of H2SL (indicated as

P6 pattern). The number of pixels in a row is dependent on readout mode – either 1213 or 2426 minimum counts required.

**Figure 23. Line and Pixel Timing**

Pixel Timing Detail

Figure 24. Pixel Timing Detail

Frame/Electronic Shutter Timing

The SUB pin may be optionally clocked to provide electronic shuttering capability as shown below. The resulting photodiode integration time is defined from the falling edge of SUB to the falling edge of V1 (P1 pattern).

## STORAGE AND HANDLING

Table 17. STORAGE CONDITIONS

Description	Symbol	Minimum	Maximum	Unit
Storage Temperature (Note 1)	T <sub>ST</sub>	-55	80	°C
Humidity (Note 2)	RH	5	90	%

1. Long-term exposure toward the maximum temperature will accelerate color filter degradation.
2. T = 25°C. Excessive humidity will degrade MTTF.

MECHANICAL INFORMATION

Completed Assembly

Notes:

1. See Ordering Information for marking code.
2. No materials to interfere with clearance through guide holes.
3. The center of the active image is nominally at the center of the package.
4. Die rotation < 0.5 degrees.
5. Cover glass placement is within recess cavity wall.
6. Internal traces may be exposed on sides of package. Do not allow metal to contact sides of ceramic package.
7. Recommended mounting screws: 1.6 x 0.35 mm (ISO Standard); 0 - 80 (Unified Fine Thread Standard).
8. Units: millimeters.

**SHIPPING CONFIGURATION**

**Cover Glass Protective Tape**

Cover glass protective tape, as shown in Figure 32, is utilized to help ensure the cleanliness of the cover glass during transportation and camera manufacturing. This protective tape is not intended to be optically correct, and

should be removed prior to any image testing. The protective tape should be removed in an ionized air stream to prevent static build-up and the attraction of particles. The following part numbers will have the protective tape applied:

**Table 18.**

Part Number	Description
KAI-04050-CBA-JB-B2	Color (Bayer RGB), Telecentric Microlens, PGA Package, Sealed Clear Cover Glass (No Coatings), Grade 2
KAI-04050-CBA-JB-AE	Color (Bayer RGB), Telecentric Microlens, PGA Package, Sealed Clear Cover Glass (No Coatings), Engineering Grade
KAI-04050-CBA-JB-B2-T	Color (Bayer RGB), Telecentric Microlens, PGA Package, Sealed Clear Cover Glass (No Coatings), Grade 2, Packed in Trays

**Table 19.**

Criteria	Description
Placement	Per the drawing. The lid tape shall not overhang the edge of the package or mounting holes. The lid tape always overhangs the top of the glass (chamfers not included).
Tab Location	The tape tab is located near pin 68.
Scratches	The tape application equipment will make slight scratches on the lid tape. This is allowed.

**Figure 32. Cover Glass Protective Tape**

# KAI-04050

## Tray Packing

The following part numbers are packed in bricks of 6 trays, each tray containing 32 image sensors, for a total of

192 image sensors per brick. The minimum order and multiple quantities for this configuration are 192 image sensors.

**Table 20.**

Part Number	Description
KAI-04050-CBA-JB-B2-T	Color (Bayer RGB), Telecentric Microlens, PGA Package, Sealed Clear Cover Glass (No Coatings), Grade 2, Packed in Trays

## Tray Configuration

### Pin-Up View

**Figure 33. Tray Pin-Up View**

### Pin-Down View

**Figure 34. Tray Pin-Down View**

# KAI-04050

## Brick Configuration

Bricks consist of 6 full trays and 1 empty tray. Each tray contains 32 image sensors. There are a total of 192 image

sensors in the brick. The ID label is applied to the top of the brick. Tray 1 is at the bottom of the brick and the empty tray is at the top of the brick.

Figure 35. Brick

The Brick ID is Encoded in the Bar Code.

ON Semiconductor and  are trademarks of Semiconductor Components Industries, LLC dba ON Semiconductor or its subsidiaries in the United States and/or other countries. ON Semiconductor owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of ON Semiconductor's product/patent coverage may be accessed at [www.onsemi.com/site/pdf/Patent-Marking.pdf](http://www.onsemi.com/site/pdf/Patent-Marking.pdf). ON Semiconductor reserves the right to make changes without further notice to any products herein. ON Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does ON Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using ON Semiconductor products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by ON Semiconductor. "Typical" parameters which may be provided in ON Semiconductor data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. ON Semiconductor does not convey any license under its patent rights nor the rights of others. ON Semiconductor products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use ON Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold ON Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that ON Semiconductor was negligent regarding the design or manufacture of the part. ON Semiconductor is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
