

SCAN18373T

Transparent Latch with 3-STATE Outputs

General Description

The SCAN18373T is a high speed, low-power transparent latch featuring separate data inputs organized into dual 9-bit bytes with byte-oriented latch enable and output enable control signals. This device is compliant with IEEE 1149.1 Standard Test Access Port and Boundary Scan Architecture with the incorporation of the defined boundary-scan test logic and test access port consisting of Test Data Input (TDI), Test Data Out (TDO), Test Mode Select (TMS), and Test Clock (TCK).

Features

- IEEE 1149.1 (JTAG) Compliant
- Buffered active-low latch enable
- 3-STATE outputs for bus-oriented applications
- 9-bit data busses for parity applications
- Reduced-swing outputs source 32 mA/sink 64 mA
- Guaranteed to drive 50Ω transmission line to TTL input levels of 0.8V and 2.0V
- TTL compatible inputs
- 25 mil pitch SSOP (Shrink Small Outline Package)
- Includes CLAMP and HIGHZ instructions
- Member of Fairchild's SCAN Products

Ordering Code:

Order Number	Package Number	Package Description
SCAN1837TSSC	MS56A	56-Lead Shrink Small Outline Package (SSOP), JEDEC MO-118, 0.300 Wide

Device also available in Tape and Reel. Specify by appending the suffix letter "X" to the ordering code.

Pin Descriptions

Pin Names	Description
AI ₍₀₋₈₎ , BI ₍₀₋₈₎	Data Inputs
ALE, BLE	Latch Enable Inputs
AOE ₁ , BOE ₁	3-STATE Output Enable Inputs
AO ₍₀₋₈₎ , BO ₍₀₋₈₎	3-STATE Latch Outputs

Truth Tables

Inputs			AO ₍₀₋₈₎
ALE	AOE ₁	AI ₍₀₋₈₎	
X	H	X	Z
H	L	L	L
H	L	H	H
L	L	X	AO ₀

Inputs			BO ₍₀₋₈₎
BLE	BOE ₁	BI ₍₀₋₈₎	
X	H	X	Z
H	L	L	L
H	L	H	H
L	L	X	BO ₀

H = HIGH Voltage Level
L = LOW Voltage Level
X = Immaterial
Z = High Impedance
AO₀ = Previous AO before H-to-L transition of ALE
BO₀ = Previous BO before H-to-L transition of BLE

Functional Description

The SCAN18373T consists of two sets of nine D-type latches with 3-STATE standard outputs. When the Latch Enable (ALE or BLE) input is HIGH, data on the inputs ($A_{i(0-8)}$ or $B_{i(0-8)}$) enters the latches. In this condition the latches are transparent, i.e., a latch output will change state each time its input changes. When Latch Enable is LOW, the latches store the information that was present on

the inputs a set-up time preceding the HIGH-to-LOW transition of the Latch Enable. The 3-STATE standard outputs are controlled by the Output Enable ($\overline{AOE_1}$ or $\overline{BOE_1}$) input. When Output Enable is LOW, the standard outputs are in the 2-state mode. When Output Enable is HIGH, the standard outputs are in the high impedance mode, but this does not interfere with entering new data into the latches.

Logic Diagram

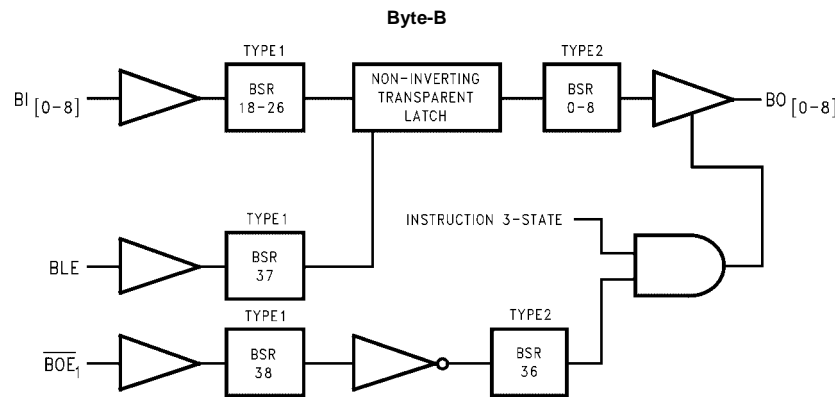

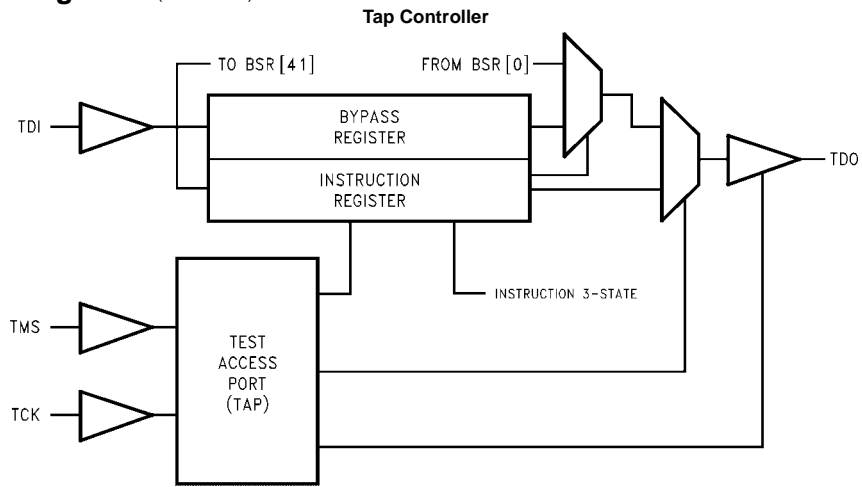

Please note that this diagram is provided only for the understanding of logic operations and should not be used to estimate propagation delays.

Block Diagrams (Continued)

Note: BSR stands for Boundary Scan Register.

Description of Boundary-Scan Circuitry

The scan cells used in the BOUNDARY-SCAN register are one of the following two types depending upon their location. Scan cell TYPE1 is intended to solely observe system data, while TYPE2 has the additional ability to control system data.

Scan cell TYPE1 is located on each system input pin while scan cell TYPE2 is located at each system output pin as well as at each of the two internal active-high output enable signals. AOE controls the activity of the A-outputs while BOE controls the activity of the B-outputs. Each will activate their respective outputs by loading a logic high.

The BYPASS register is a single bit shift register stage identical to scan cell TYPE1. It captures a fixed logic low.

Bypass Register Scan Chain Definition Logic 0

The INSTRUCTION register is an eight-bit register which captures the value 00111101.

The two least significant bits of this captured value (01) are required by IEEE Std 1149.1. The upper six bits are unique

to the SCAN18373T device. SCAN CMOS Test Access Logic devices do not include the IEEE 1149.1 optional identification register. Therefore, this unique captured value can be used as a "pseudo ID" code to confirm that the correct device is placed in the appropriate location in the boundary scan chain.

Instruction Register Scan Chain Definition

MSB → LSB

Instruction Code	Instruction
00000000	EXTEST
10000001	SAMPLE/PRELOAD

Absolute Maximum Ratings(Note 1)

Supply Voltage (V_{CC})	-0.5V to +7.0V
DC Input Diode Current (I_{IK})	
$V_I = -0.5V$	-20 mA
$V_I = V_{CC} + 0.5V$	+20 mA
DC Output Diode Current (I_{OK})	
$V_O = -0.5V$	-20 mA
$V_O = V_{CC} + 0.5V$	+20 mA
DC Output Voltage (V_O)	-0.5V to $V_{CC} + 0.5V$
DC Output Source/Sink Current (I_O)	± 70 mA
DC V_{CC} or Ground Current	
Per Output Pin	± 70 mA
Junction Temperature	
SSOP	+140°C
Storage Temperature	-65°C to +150°C
ESD (Min)	2000V

Recommended Operating Conditions

Supply Voltage (V_{CC})	4.5V to 5.5V
SCAN Products	0V to V_{CC}
Input Voltage (V_I)	0V to V_{CC}
Output Voltage (V_O)	0V to V_{CC}
Operating Temperature (T_A)	-40°C to +85°C
Minimum Input Edge Rate $\Delta V/\Delta t$	125 mV/ns
V_{IN} from 0.8V to 2.0V	
V_{CC} @ 4.5V, 5.5V	

Note 1: Absolute maximum ratings are those values beyond which damage to the device may occur. The databook specifications should be met, without exception, to ensure that the system design is reliable over its power supply, temperature, and output/input loading variables. Fairchild does not recommend operation of SCAN circuits outside databook specifications.

DC Electrical Characteristics

T _{dn}	Power Down Delay	0.0	100	100	ms

Note 11: Voltage Range 5.0 is 5.0V ± 0.5V.

Note 12: This delay represents the timing relationship between the data input and TCK at the associated scan cells numbered 0-8, 9-17, 18-26 and 27-35.

Note 13: Timing pertains to BSR 38 and 41 only.

Note 14: This delay represents the timing relationship between AOE/BOE and TCK for scan cells 36 and 39 only.

Note 15: Timing pertains to BSR 37 and 40 only.

Note: All Input Timing Delays involving TCK are measured from the rising edge of TCK.

Extended AC Electrical Characteristics

t _{OSLH} (Note 20)	Pin to Pin Skew LH Data to Output		0.5	1.0		1.0	ns

Note 16: This specification is guaranteed but not tested. The limits apply to propagation delays for all paths described switching in phase (i.e., all LOW-to-HIGH, HIGH-to-LOW, etc.).

Note 17: This specification is guaranteed but not tested. The limits represent propagation delays with 250 pF load capacitors in place of the 50 pF load capacitors in the standard AC load. This specification pertains to single output switching only.

Note 18: 3-STATE delays are load dominated and have been excluded from the datasheet.

Note 19: The Output Disable Time is dominated by the RC network (500Ω, 250 pF) on the output and has been excluded from the datasheet.

Note 20: Skew is defined as the absolute value of the difference between the actual propagation delays for any two separate outputs of the same device. The specification applies to any outputs switching HIGH-to-LOW (t_{OSSLH}), LOW-to-HIGH (t_{OSLH}), or any combination switching LOW-to-HIGH.
