Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor's system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (_), the underscore (_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (_). Please check the ON Semiconductor website to verify the updated device numbers. The most current and up-to-date ordering information can be found at www.onsemi.com. Please email any questions regarding the system integration to Fairchild_questions@onsemi.com.

Functional Description

The ACT825 consists of eight D-type edge-triggered flip-flops. These devices have 3-STATE outputs for bus systems, organized in a broadside pinning. In addition to the clock and output enable pins, the buffered clock (CP) and buffered Output Enable (\overline{OE}) are common to all flip-flops. The flip-flops will store the state of their individual D inputs that meet the setup and hold time requirements on the LOW-to-HIGH CP transition. With \overline{OE}_1 , \overline{OE}_2 and \overline{OE}_3 LOW, the contents of the flip-flops are available at the outputs. When one of \overline{OE}_1 , \overline{OE}_2 or \overline{OE}_3 is HIGH, the outputs go to the high impedance state.

Operation of the \overline{OE} input does not affect the state of the flip-flops. The ACT825 has Clear (\overline{CLR}) and Clock Enable (\overline{EN}) pins. These pins are ideal for parity bus interfacing in high performance systems.

When \overline{CLR} is LOW and \overline{OE} is LOW, the outputs are LOW. When \overline{CLR} is HIGH, data can be entered into the flip-flops. When \overline{EN} is LOW, data on the inputs is transferred to the outputs on the LOW-to-HIGH clock transition. When \overline{EN} is HIGH, the outputs do not change state, regardless of the data or clock input transitions.
