### DESCRIPTION

The M74HC367 is an high speed CMOS HEX BUS BUFFER 3-STATE OUTPUTS fabricated with silicon gate C<sup>2</sup>MOS technology. This device contains six buffers, four buffers are controlled by an enable input ( $\overline{G1}$ ) and the other two buffers are controlled by the other enable input ( $\overline{G2}$ ); the outputs of each buffer group are

enabled when  $\overline{G1}$  and/or  $\overline{G2}$  inputs are held low, and when held high, these outputs are disabled in a high-impedance state. All inputs are equipped with protection circuits against static discharge and transient excess voltage.
