### NCP1607B00STGEVB: 100 W Boost Evaluation Board

The NCP1607 is a voltage mode power factor correction controller designed to drive cost-effective converters to meet input line harmonic regulations. The device operates in Critical Conduction Mode (CRM) for optimal performance in applications up to about 300 W. Its voltage mode scheme enables it to obtain unity power factor without the need for a line sensing network. The output voltage is accurately controlled with a built in high precision error amplifier. The controller also implements a comprehensive array of safety features for robust designs.

### **Features and Applications**

Features

- High power factor
- Low standby power dissipation
- High active mode efficiency
- Open feedback loop protection
