## MC74LCX574

## Low－Voltage CMOS Octal D－Type Flip－Flop Flow Through Pinout

## With 5 V－Tolerant Inputs and Outputs （3－State，Non－Inverting）

The MC74LCX574 is a high performance，non－inverting octal D－type flip－flop operating from a 2.3 to 3.6 V supply．High impedance TTL compatible inputs significantly reduce current loading to input drivers while TTL compatible outputs offer improved switching noise performance． $\mathrm{A} \mathrm{V}_{\mathrm{I}}$ specification of 5.5 V allows MC74LCX574 inputs to be safely driven from 5.0 V devices．

The MC74LCX574 consists of 8 edge－triggered flip－flops with individual D－type inputs and 3－state true outputs．The buffered clock and buffered Output Enable（ $\overline{\mathrm{OE}}$ ）are common to all flip－flops．The eight flip－flops will store the state of individual D inputs that meet the setup and hold time requirements on the LOW－to－HIGH Clock（CP） transition．With the $\overline{\mathrm{OE}}$ LOW，the contents of the eight flip－flops are available at the outputs．When the $\overline{\mathrm{OE}}$ is HIGH ，the outputs go to the high impedance state．The $\overline{\mathrm{OE}}$ input level does not affect the operation of the flip－flops．The LCX574 flow through design facilitates easy PC board layout．

## Features

－Designed for 2.3 to $3.6 \mathrm{~V} \mathrm{~V}_{\mathrm{CC}}$ Operation
－ 5 V Tolerant－Interface Capability With 5 V TTL Logic
－Supports Live Insertion and Withdrawal
－ $\mathrm{I}_{\mathrm{OFF}}$ Specification Guarantees High Impedance When $\mathrm{V}_{\mathrm{CC}}=0 \mathrm{~V}$
－LVTTL Compatible
－LVCMOS Compatible
－24mA Balanced Output Sink and Source Capability
－Near Zero Static Supply Current in All Three Logic States（10 $\mu \mathrm{A}$ ） Substantially Reduces System Power Requirements
－Latchup Performance Exceeds 500 mA
－ESD Performance：Human Body Model＞2000 V
Machine Model＞200 V
－ $\mathrm{Pb}-$ Free Packages are Available＊

Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

1. Output in HIGH or LOW State. Io absolute maximum rating must be observed.
