

MC100EPT21

3.3V Differential LVPECL/LVDS/CML to LVTTTL/LVCMOS Translator

The MC100EPT21 is a Differential LVPECL/LVDS/CML to LVTTTL/LVCMOS translator. Because LVPECL (Positive ECL), LVDS, and positive CML input levels and LVTTTL/LVCMOS output levels are used, only +3.3 V and ground are required. The small outline 8-lead SOIC package makes the EPT21 ideal for applications which require the translation of a clock or data signal.

The V_{BB} output allows this EPT21 to be cap coupled in either single-ended or differential input mode. When single-ended cap coupled, V_{BB} output is tied to the \bar{D} input and D is driven for a non-inverting buffer, or V_{BB} output is tied to the D input and \bar{D} is driven for an inverting buffer. When cap coupled differentially, V_{BB} output is connected through a resistor to each input pin. If used, the V_{BB} pin should be bypassed to V_{CC} via a 0.01 μF capacitor. For additional information see AND8020/D. For a single-ended direct connection use an external voltage reference source such as a resistor divider. Do not use V_{BB} for a single-ended direct connection or port to another device.

Features

- 1.4 ns Typical Propagation Delay
- Maximum Frequency > 275 MHz Typical
- LVPECL/LVDS/CML Inputs, LVTTTL/LVCMOS Outputs
- 24 mA TTL outputs
- Operating Range: $V_{CC} = 3.0\text{ V}$ to 3.6 V with $GND = 0\text{ V}$
- The 100 Series Contains Temperature Compensation
- V_{BB} Output
- Pb-Free Packages are Available

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

3. Input parameters vary 1:1 with V_{CC} .

4. V_{IHCMR} min varies 1:1 with GND , V_{IHCMR} max varies 1:1 with V_{CC} . The V_{IHCMR} range is referenced to the most positive side of the differential input signal.
