

# **Noninverting 3-State Buffer**

## MC74VHC1G126, MC74VHC1GT126

The MC74VHC1G126 / MC74VHC1GT126 is a single gate noninverting 3-state buffer in tiny footprint packages. The MC74VHC1G126 has CMOS-level input thresholds while the MC74VHC1GT126 has TTL-level input thresholds.

The internal circuit is composed of three stages, including a buffered 3–state output which provides high noise immunity and stable output.

The input structures provide protection when voltages up to 5.5 V are applied, regardless of the supply voltage. This allows the device to be used to interface 5 V circuits to 3 V circuits. Some output structures also provide protection when  $V_{CC}=0$  V and when the output voltage exceeds  $V_{CC}$ . These input and output structures help prevent device destruction caused by supply voltage — input/output voltage mismatch, battery backup, hot insertion, etc.

<sup>5.</sup> C<sub>PD</sub> is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load. Average operating current can be obtained by the equation: I<sub>CC(OPR)</sub> = C<sub>PD</sub> • V<sub>CC</sub> • f<sub>in</sub> + I<sub>CC</sub>. C<sub>PD</sub> is used to determine the no–load dynamic power consumption; P<sub>D</sub> = C<sub>PD</sub> • V<sub>CC</sub><sup>2</sup> • f<sub>in</sub> + I<sub>CC</sub> • V<sub>CC</sub>.
