## MC14551B

## Quad 2-Channel Analog Multiplexer/Demultiplexer

The MC14551B is a digitally-controlled analog switch. This device implements a 4PDT solid state switch with low ON impedance and very low OFF Leakage current. Control of analog signals up to the complete supply voltage range can be achieved.

## Features

- Triple Diode Protection on All Control Inputs
- Supply Voltage Range $=3.0 \mathrm{Vdc}$ to 18 Vdc
- Analog Voltage Range $\left(\mathrm{V}_{\mathrm{DD}}-\mathrm{V}_{\mathrm{EE}}\right)=3.0$ to 18 V

Note: $\mathrm{V}_{\mathrm{EE}}$ must be $\leq \mathrm{V}_{\mathrm{SS}}$

- Linearized Transfer Characteristics
- Low Noise - $12 \mathrm{nV} \sqrt{\text { Cycle }}, \mathrm{f} \geq 1.0 \mathrm{kHz}$ typical
- For Low R ${ }_{\text {ON }}$, Use The HC4051, HC4052, or HC4053 High-Speed CMOS Devices
- Switch Function is Break Before Make
- These Devices are $\mathrm{Pb}-$ Free and are RoHS Compliant
- NLV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable

## MAXIMUM RATINGS

| Parameter | Symbol | Value | Unit |
| :--- | :---: | :---: | :---: |
| DC Supply Voltage Range <br> (Referenced to $\left.\mathrm{V}_{\mathrm{EE}}, \mathrm{V}_{\mathrm{SS}} \geq \mathrm{V}_{\mathrm{EE}}\right)$ | $\mathrm{V}_{\mathrm{DD}}$ | -0.5 to +18.0 | V |
| Input or Output Voltage (DC or Transient) <br> (Referenced to $\mathrm{V}_{\text {SS }}$ for Control Input and <br> $\mathrm{V}_{\text {EE }}$ for Switch I/O) | $\mathrm{V}_{\text {in }}, \mathrm{V}_{\text {out }}$ | -0.5 to $\mathrm{V}_{\mathrm{DD}}$ <br> +0.5 | V |
| Input Current (DC or Transient), <br> per Control Pin | $\mathrm{I}_{\text {in }}$ | $\pm 10$ | mA |
| Switch Through Current | $\mathrm{I}_{\mathrm{Sw}}$ | $\pm 25$ | mA |
| Power Dissipation, per Package (Note 1) | $\mathrm{P}_{\mathrm{D}}$ | 500 | mW |
| Ambient Temperature Range | $\mathrm{T}_{\mathrm{A}}$ | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature Range | $\mathrm{T}_{\mathrm{Stg}}$ | -65 to +150 | ${ }^{\circ} \mathrm{C}$ |
| Lead Temperature (8-Second Soldering) | $\mathrm{T}_{\mathrm{L}}$ | 260 | ${ }^{\circ} \mathrm{C}$ |

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. Temperature Derating: Plastic " $P$ and $D / D W$ "

Packages: - $7.0 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$ From $65^{\circ} \mathrm{C}$ To $125^{\circ} \mathrm{C}$
This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, $\mathrm{V}_{\text {in }}$ and $\mathrm{V}_{\text {out }}$ should be constrained to the range $\mathrm{V}_{\mathrm{SS}} \leq\left(\mathrm{V}_{\text {in }}\right.$ or $\left.\mathrm{V}_{\text {out }}\right) \leq \mathrm{V}_{\mathrm{DD}}$ for control inputs and $\mathrm{V}_{\mathrm{EE}} \leq\left(\mathrm{V}_{\text {in }}\right.$ or $\left.\mathrm{V}_{\text {out }}\right)$ $\leq V_{\text {DD }}$ for Switch I/O.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either $\mathrm{V}_{\mathrm{SS}}, \mathrm{V}_{\mathrm{EE}}$ or $\left.\mathrm{V}_{\mathrm{DD}}\right)$. Unused outputs must be left open.

2. Data labeled "Typ" is not to be used for design purposes, but is intended as an indication of the IC's potential performance.
3. For voltage drops across the switch $\left(\Delta V_{\text {switch }}\right)>600 \mathrm{mV}$ ( $>300 \mathrm{mV}$ at high temperature), excessive $\mathrm{V}_{\mathrm{DD}}$ current may be drawn; i.e. the current out of the switch may contain both $\mathrm{V}_{\mathrm{DD}}$ and switch input components. The reliability of the device will be unaffected unless the Maximum Ratings are exceeded. (See first page of this data sheet.)

## APPLICATIONS INFORMATION

Figure A illustrates use of the on-chip level converter detailed in Figure 2. The 0-to-5.0 V Digital Control signal is used to directly control a $9 \mathrm{~V}_{\mathrm{p}-\mathrm{p}}$ analog signal.

The digital control logic levels are determined by $\mathrm{V}_{\mathrm{DD}}$ and $\mathrm{V}_{\mathrm{SS}}$. The $\mathrm{V}_{\mathrm{DD}}$ voltage is the logic high voltage; the $\mathrm{V}_{\mathrm{SS}}$ voltage is logic low. For the example, $\mathrm{V}_{\mathrm{DD}}=+5.0 \mathrm{~V}=$ logic high at the control inputs; $\mathrm{V}_{\mathrm{SS}}=\mathrm{GND}=0 \mathrm{~V}=$ logic low.

The maximum analog signal level is determined by $\mathrm{V}_{\mathrm{DD}}$ and $\mathrm{V}_{\mathrm{EE}}$. The $\mathrm{V}_{\mathrm{DD}}$ voltage determines the maximum recommended peak above $\mathrm{V}_{\mathrm{SS}}$. The $\mathrm{V}_{\mathrm{EE}}$ voltage determines the maximum swing below $\mathrm{V}_{\mathrm{SS}}$. For the example, $\mathrm{V}_{\mathrm{DD}}-\mathrm{V}_{\mathrm{SS}}$ $=5.0 \mathrm{~V}$ maximum swing above $\mathrm{V}_{\mathrm{SS}} ; \mathrm{V}_{\mathrm{SS}}-\mathrm{V}_{\mathrm{EE}}=5.0 \mathrm{~V}$ maximum swing below $\mathrm{V}_{\mathrm{SS}}$. The example shows a $\pm 4.5 \mathrm{~V}$
signal which allows a $1 / 2 \mathrm{~V}$ margin at each peak. If voltage transients above $\mathrm{V}_{\mathrm{DD}}$ and/or below $\mathrm{V}_{\mathrm{EE}}$ are anticipated on the analog channels, external diodes $\left(\mathrm{D}_{\mathrm{x}}\right)$ are recommended as shown in Figure B. These diodes should be small signal types able to absorb the maximum anticipated current surges during clipping.

The absolute maximum potential difference between $\mathrm{V}_{\mathrm{DD}}$ and $\mathrm{V}_{\mathrm{EE}}$ is 18 V . Most parameters are specified up to 15 V which is the recommended maximum difference between $V_{D D}$ and $V_{E E}$.

Balanced supplies are not required. However, $\mathrm{V}_{\mathrm{SS}}$ must be greater than or equal to $\mathrm{V}_{\mathrm{EE}}$. For example, $\mathrm{V}_{\mathrm{DD}}=+10 \mathrm{~V}, \mathrm{~V}_{\mathrm{SS}}$ $=+5.0 \mathrm{~V}$, and $\mathrm{V}_{\mathrm{EE}}=-3.0 \mathrm{~V}$ is acceptable. See the table below.
