gDDR3 SDRAM Graphics Addendum

MT41J128M16 – 16 Meg x 16 x 8 Banks

Features

- $V_{DD} = V_{DDQ}$ = +1.5V (1.425–1.575V)
- $V_{DD} = V_{DDQ}$ = +1.35V (1.283–1.45V) capable at down clocked speeds
- Differential bidirectional data strobe
- 8*n*-bit prefetch architecture
- Differential clock inputs (CK, CK#)
- 8 internal banks
- Nominal and dynamic on-die termination (ODT) for data, strobe, and mask signals
- Programmable CAS READ latency (CL)
- Posted CAS additive latency (AL): 0, CL - 1, CL - 2
- Programmable CAS WRITE latency (CWL)
- Fixed burst length (BL) of 8 and burst chop (BC) of 4 (via the mode register set [MRS])
- Selectable BC4 or BL8 on-the-fly (OTF)
- Self refresh mode
- T_C of 0°C to 95°C
  - 64ms, 8192 cycle refresh at 0°C to 85°C
  - 32ms at 85°C to 115°C
- Self refresh temperature (SRT)
- Automatic self refresh (ASR)
- Write leveling
- Multipurpose register
- Output driver calibration

Options	Marking
• Configuration	
– 128 Meg x 16	128M16
• FBGA package (Pb-free) – x16	
– 96-ball (9mm x 14mm) Rev. D	HA
– 96-ball (8mm x 14mm) Rev. K	JT
• Timing – cycle time	
– 1.0ns @ CL = 14 (gDDR3-2000)	-093G [1]
– 1.1ns @ CL = 13 (gDDR3-1800)	-107G
– 1.25ns @ CL = 11 (gDDR3-1600)	-125G
• Operating temperature	
– Commercial (0°C ≤ T_C ≤ 95°C)	None
• Revision	:D[2]/:K

Notes:
1. Only available on Revision K.
2. Revision D is not 1.35V capable.
3. For complete device functionality and specifications, refer to the standard 2Gb DDR3 SDRAM data sheet found at www.micron.com. The information in this data sheet supersedes the standard data sheet.

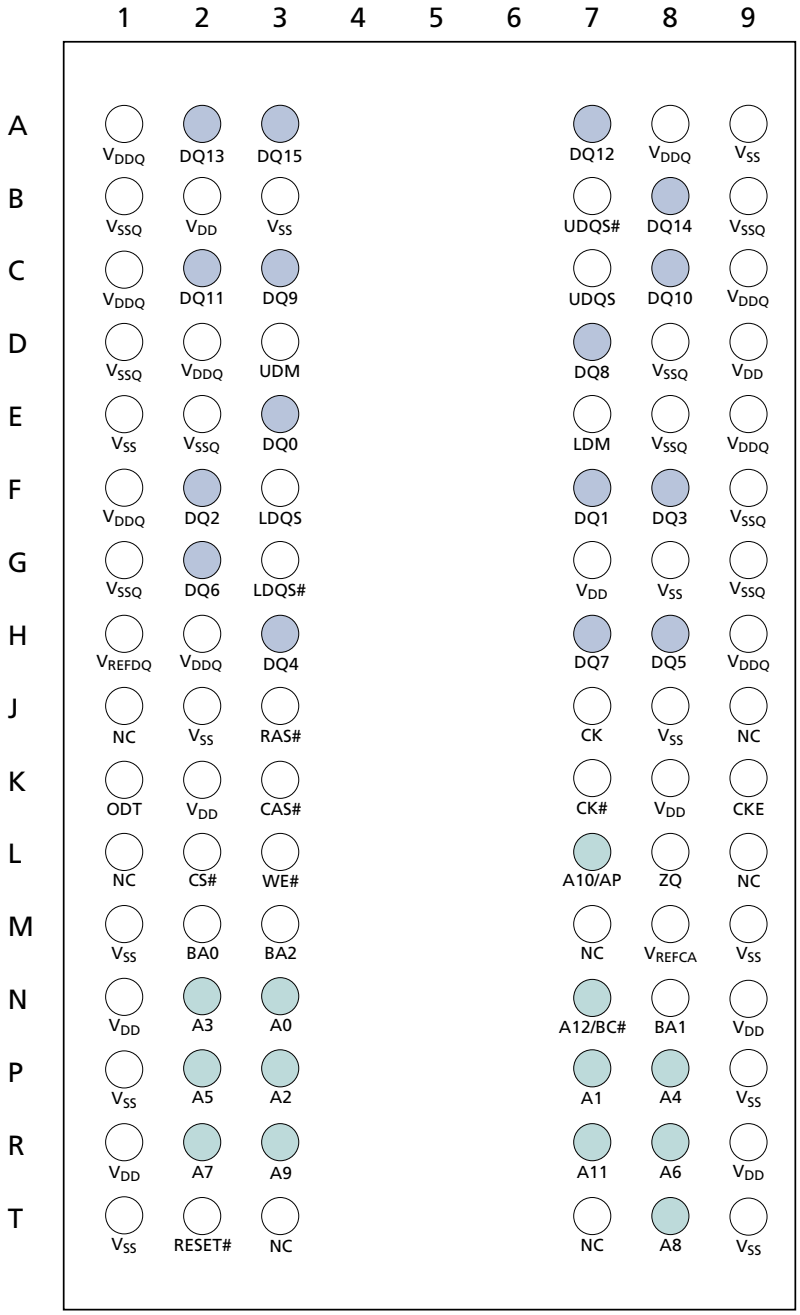
FBGA Part Marking Decoder

Due to space limitations, FBGA-packaged components have an abbreviated part marking that is different from the part number. Micron's FBGA part marking decoder is available at www.micron.com/decoder.

Ball Assignments

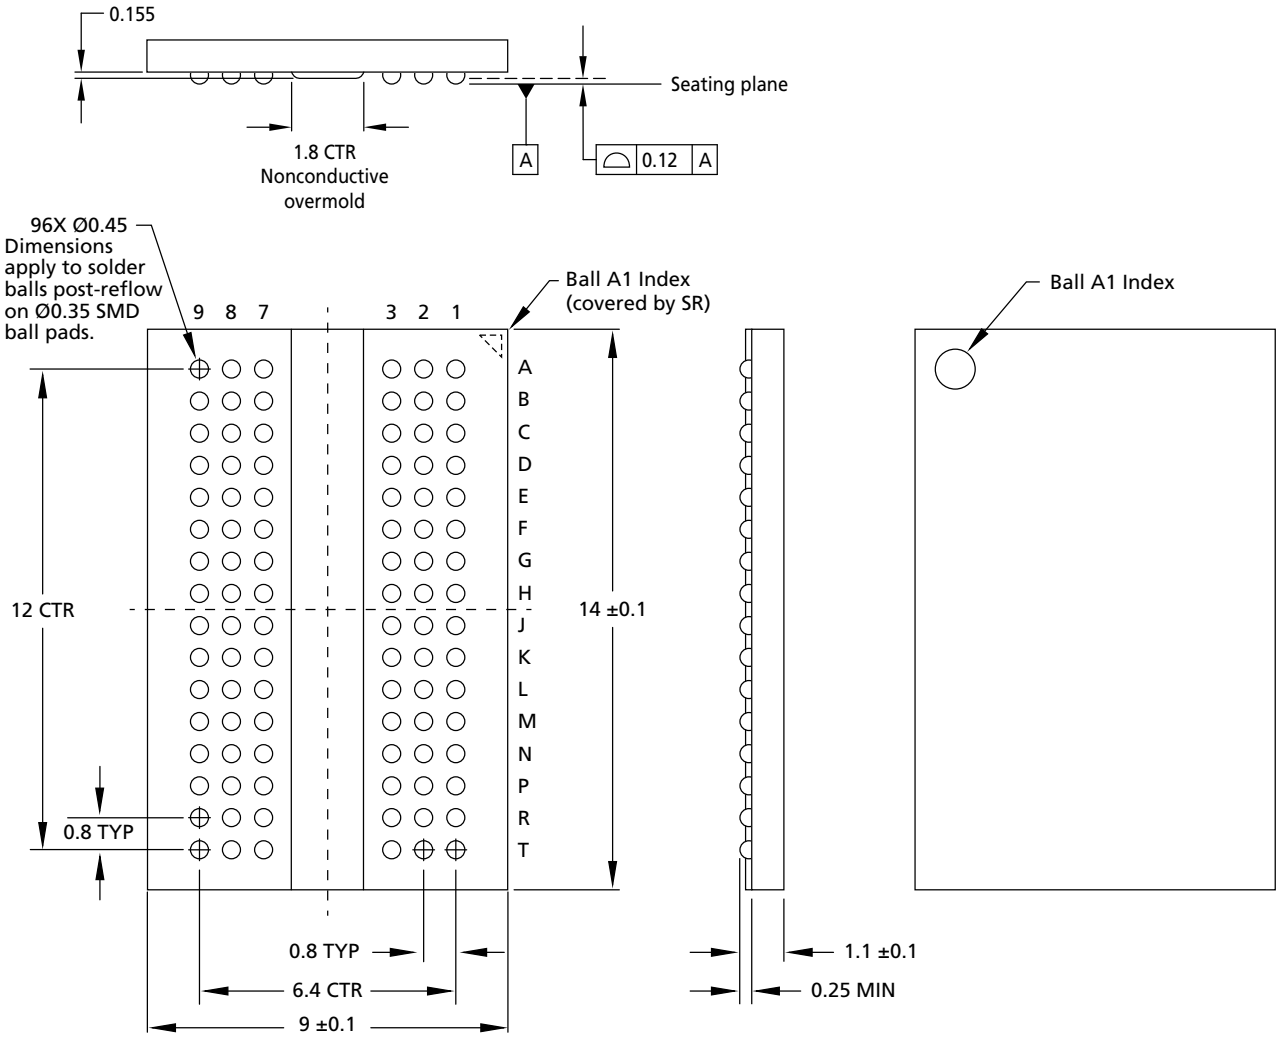
Figure 1: 96-Ball FBGA – x16 (Top View)



Notes:
1. Ball descriptions are listed in the main 2Gb DDR3 data sheet.
2. A comma separates the configuration; a slash defines a selectable function. Example D7 = NF, NF/TDQS# is selectable between NF or TDQS# via MRS.

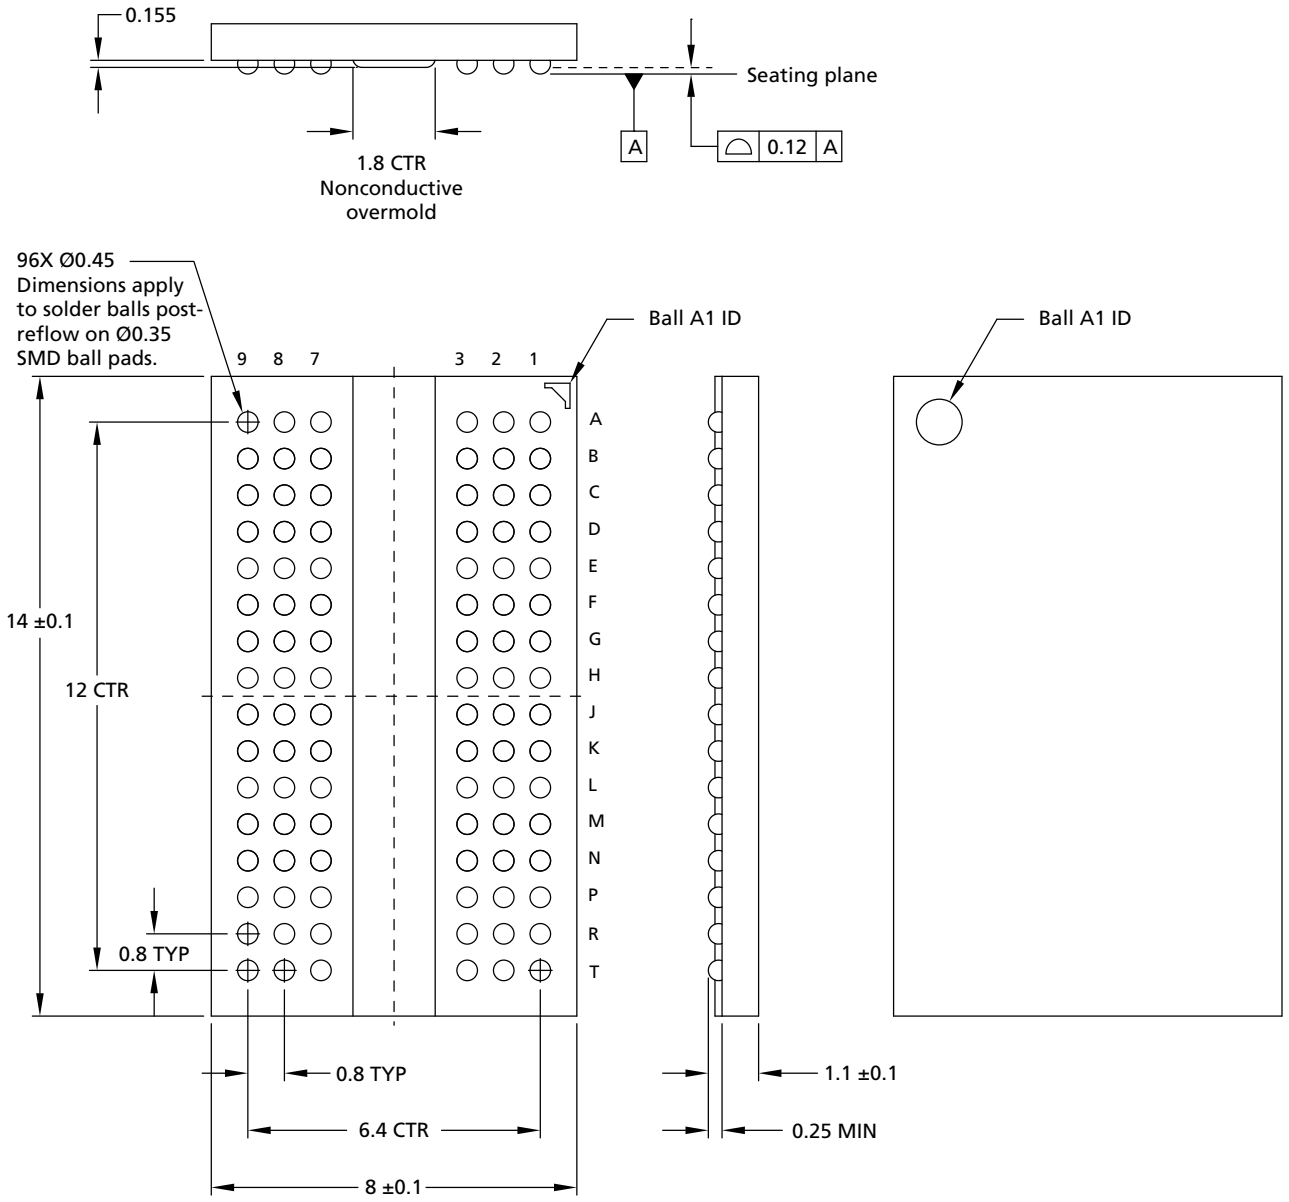
Package Dimensions

Figure 2: 96-Ball FBGA – x16 (HA)



Notes:
1. All dimensions are in millimeters.
2. Solder ball material: SAC 305: 96.5% Sn, 3% Ag, 0.5% Cu.

Figure 3: 96-Ball FBGA – x16 (JT)



Notes:
1. All dimensions are in millimeters.

Electrical Specifications

Table 4: DC Electrical Characteristics and Operating Conditions

All voltages are referenced to V_{SS}

Parameter/Condition	Symbol	Min	Nom	Max	Unit	Notes
Supply voltage	V_{DD}	1.425	1.5	1.575	V	1, 2, 3
I/O supply voltage	V_{DDQ}	1.425	1.5	1.575	V	1, 2 ,3
Supply voltage	V_{DD}	1.283	1.35	1.45	V	1, 2, 4
I/O supply voltage	V_{DDQ}	1.283	1.35	1.45	V	1, 2, 4

Notes:
1. V_{DD} and V_{DDQ} must track one another. V_{DDQ} must be ≤ V_{DD}. $V_{SS} = V_{SSQ}$.
2. V_{DD} and V_{DDQ} may include AC noise of ±50mV (250 kHz to 20 MHz) in addition to the DC (0 Hz to 250 kHz) specifications. V_{DD} and V_{DDQ} must be at same level for valid AC timing parameters.
3. Valid with all speed bins.
4. Not for use with -093 speed bin.

Reset pin capacitance	C_{RE}	–	3.0	–	3.0	–	3.0	pF	

Notes:
1. V_{DD} = 1.5V ±0.075mV, $V_{DDQ} = V_{DD}$, $V_{REF} = V_{SS}$, *f* = 100 MHz, T_C = 25°C. $V_{OUT(DC)}$ = 0.5 × V_{DDQ}, V_{OUT} = 0.1V (peak-to-peak).
2. DM input is grouped with I/O pins, reflecting the fact that they are matched in loading.
3. Includes TDQS, TDQS#. C_{DDQS} is for DQS vs. DQS# and TDQS vs. TDQS# separately.
4. $C_{DIO} = C_{IO(DQ)} - 0.5 \times (C_{IO(DQS)} + C_{IO(DQS\#)})$.
5. Excludes CK, CK#; CTRL = ODT, CS#, and CKE; CMD = RAS#, CAS#, and WE#; ADDR = A[*n*:0], BA[2:0].
6. $C_{DI\_CTRL} = C_{I(CTRL)} - 0.5 \times (C_{CK(CK)} + C_{CK(CK\#)})$.
7. $C_{DI\_CMD\_ADDR} = C_{I(CMD\_ADDR)} - 0.5 \times (C_{CK(CK)} + C_{CK(CK\#)})$.

Electrical Characteristics – I_{DD} Specifications

I_{DD} values are for full operating range of voltage and temperature unless otherwise noted.

Notes:
1. T_C = 85°C; SRT and ASR are disabled.
2. Enabling ASR could increase I_{DDx} by up to an additional 2mA.
3. Restricted to T_C (MAX) = 85°C.
4. T_C = 85°C; ASR and ODT are disabled; SRT is enabled.
5. The I_{DD} values must be derated (increased) on IT-option devices when operated outside of the range 0°C ≤ T_C ≤ 85°C:

   5a. When T_C < 0°C: I_{DD2P} and I_{DD3P} must be derated by 4%; I_{DD4R} and I_{DD5W} must be derated by 2%; and I_{DD6} and I_{DD7} must be derated by 7%.

   5b. When T_C > 85°C: I_{DD0}, I_{DD1}, I_{DD2N}, I_{DD2NT}, I_{DD2Q}, I_{DD3N}, I_{DD3P}, I_{DD4R}, I_{DD4W}, and I_{DD5W} must be derated by 2%; I_{DD2Px} must be derated by 30%.

Notes:
1. Parameters are applicable with 0°C ≤ T_C ≤ 95°C and V_{DD}/V_{DDQ} = 1.5V ±0.075V.
2. All voltages are referenced to V_{SS}.
3. Output timings are only valid for R_{ON34} output buffer selection.
4. The unit tCK (AVG) represents the actual tCK (AVG) of the input clock under operation. The unit CK represents one clock cycle of the input clock, counting the actual clock edges.
5. AC timing and I_{DD} tests may use a V_{IL}-to-V_{IH} swing of up to 900mV in the test environment, but input timing is still referenced to V_{REF} (except tIS, tIH, tDS, and tDH use the

AC/DC trip points, and CK, CK# and DQS, DQS# use their crossing points). The minimum slew rate for the input signals used to test the device is 1 V/ns for single-ended inputs and 2 V/ns for differential inputs in the range between $V_{IL(AC)}$ and $V_{IH(AC)}$.

6. All timings that use time-based values (ns, µs, ms) should use ^{t}CK (AVG) to determine the correct number of clocks (this table uses CK or ^{t}CK [AVG] interchangeably). In the case of noninteger results, all minimum limits are to be rounded up to the nearest whole integer, and all maximum limits are to be rounded down to the nearest whole integer.
7. Strobe or DQSdiff refers to the DQS and DQS# differential crossing point when DQS is the rising edge. Clock or CK refers to the CK and CK# differential crossing point when CK is the rising edge.
8. This output load is used for all AC timing (except ODT reference timing) and slew rates. The actual test load may be different. The output signal voltage reference point is $V_{DDQ}/2$ for single-ended signals and the crossing point for differential signals.
9. When operating in DLL disable mode, Micron does not warrant compliance with normal mode timings or functionality.
10. The clock's ^{t}CK (AVG) is the average clock over any 200 consecutive clocks and ^{t}CK (AVG) MIN is the smallest clock rate allowed, with the exception of a deviation due to clock jitter. Input clock jitter is allowed provided it does not exceed values specified and must be of a random Gaussian distribution in nature.
11. Spread spectrum is not included in the jitter specification values. However, the input clock can accommodate spread-spectrum at a sweep rate in the range of 20–60 kHz with an additional 1% of ^{t}CK (AVG) as a long-term jitter component; however, the spread spectrum may not use a clock rate below ^{t}CK (AVG) MIN.
12. The clock's ^{t}CH (AVG) and ^{t}CL (AVG) are the average half clock period over any 200 consecutive clocks and is the smallest clock half period allowed, with the exception of a deviation due to clock jitter. Input clock jitter is allowed provided it does not exceed values specified and must be of a random Gaussian distribution in nature.
13. The period jitter ($^{t}JIT_{PER}$) is the maximum deviation in the clock period from the average or nominal clock. It is allowed in either the positive or negative direction.
14. ^{t}CH (ABS) is the absolute instantaneous clock high pulse width as measured from one rising edge to the following falling edge.
15. ^{t}CL (ABS) is the absolute instantaneous clock low pulse width as measured from one falling edge to the following rising edge.
16. The cycle-to-cycle jitter $^{t}JIT_{CC}$ is the amount the clock period can deviate from one cycle to the next. It is important to keep cycle-to-cycle jitter at a minimum during the DLL locking time.
17. The cumulative jitter error ^{t}ERR*n*PER, where *n* is the number of clocks between 2 and 50, is the amount of clock time allowed to accumulate consecutively away from the average clock over *n* number of clock cycles.
18. ^{t}DS (base) and ^{t}DH (base) values are for a single-ended 1 V/ns DQ slew rate and 2 V/ns differential DQS, DQS# slew rate.
19. These parameters are measured from a data signal (DM, DQ0, DQ1, and so forth) transition edge to its respective data strobe signal (DQS, DQS#) crossing.
20. The setup and hold times are listed converting the base specification values (to which derating tables apply) to V_{REF} when the slew rate is 1 V/ns. These values, with a slew rate of 1 V/ns, are for reference only.
21. When the device is operated with input clock jitter, this parameter needs to be derated by the actual $^{t}JIT_{PER}$ (larger of $^{t}JIT_{PER}$ (MIN) or $^{t}JIT_{PER}$ (MAX) of the input clock (output deratings are relative to the SDRAM input clock).
22. Single-ended signal parameter.
23. The DRAM output timing is aligned to the nominal or average clock. Most output parameters must be derated by the actual jitter error when input clock jitter is present, even when within specification. This results in each parameter becoming larger. The following parameters are required to be derated by subtracting $^{t}ERR_{10PER}$ (MAX): ^{t}DQSCK

(MIN), ^{t}LZ(DQS) MIN, ^{t}LZ(DQ) MIN, and ^{t}AON (MIN). The following parameters are required to be derated by subtracting $^{t}ERR_{10PER}$ (MIN): ^{t}DQSCK (MAX), ^{t}HZ (MAX), ^{t}LZ (DQS) MAX, ^{t}LZ (DQ) MAX, and ^{t}AON (MAX). The parameter ^{t}RPRE (MIN) is derated by subtracting $^{t}JIT_{PER}$ (MAX), while ^{t}RPRE (MAX) is derated by subtracting $^{t}JIT_{PER}$ (MIN).

24. The maximum preamble is bound by ^{t}LZDQS (MAX).
25. These parameters are measured from a data strobe signal (DQS, DQS#) crossing to its respective clock signal (CK, CK#) crossing. The specification values are not affected by the amount of clock jitter applied because these are relative to the clock signal crossing. These parameters should be met whether clock jitter is present.
26. The ^{t}DQSCK (DLL_DIS) parameter begins CL + AL - 1 cycles after the READ command.
27. The maximum postamble is bound by ^{t}HZDQS (MAX).
28. Commands requiring a locked DLL are READ (and RDAP) and synchronous ODT commands. In addition, after any change of latency ^{t}XPDLL, timing must be met.
29. ^{t}IS (base) and ^{t}IH (base) values are for a single-ended 1 V/ns control/command/address slew rate and 2 V/ns CK, CK# differential slew rate.
30. These parameters are measured from a command/address signal transition edge to its respective clock (CK, CK#) signal crossing. The specification values are not affected by the amount of clock jitter applied as the setup and hold times are relative to the clock signal crossing that latches the command/address. These parameters should be met whether clock jitter is present.
31. For these parameters, the DDR3 SDRAM device supports ^{t}nPARAM (*n*CK) = RU(^{t}PARAM [ns]/^{t}CK[AVG] [ns]), assuming all input clock jitter specifications are satisfied. For example, the device will support ^{t}nRP (*n*CK) = RU(^{t}RP/^{t}CK[AVG]) if all input clock jitter specifications are met. This means that for DDR3-800 6-6-6, of which ^{t}RP = 15ns, the device will support ^{t}nRP = RU(^{t}RP/^{t}CK[AVG]) = 6 as long as the input clock jitter specifications are met. That is, the PRECHARGE command at T0 and the ACTIVATE command at T0 + 6 are valid even if six clocks are less than 15ns due to input clock jitter.
32. During READs and WRITEs with auto precharge, the DDR3 SDRAM will hold off the internal PRECHARGE command until ^{t}RAS (MIN) has been satisfied.
33. When operating in DLL disable mode, the greater of 4CK or 15ns is satisfied for ^{t}WR.
34. The start of the write recovery time is defined as follows:
    - For BL8 (fixed by MRS and OTF): Rising clock edge four clock cycles after WL
    - For BC4 (OTF): Rising clock edge four clock cycles after WL
    - For BC4 (fixed by MRS): Rising clock edge two clock cycles after WL
35. RESET# should be LOW as soon as power starts to ramp to ensure the outputs are in High-Z. Until RESET# is LOW, the outputs are at risk of driving and could result in excessive current, depending on bus activity.
36. The refresh period is 64ms when T_C is less than or equal to 85°C. This equates to an average refresh rate of 7.8125µs. However, nine REFRESH commands should be asserted at least once every 70.3µs. When T_C is greater than 85°C, the refresh period is 32ms.
37. Although CKE is allowed to be registered LOW after a REFRESH command when ^{t}REFPDEN (MIN) is satisfied, there are cases where additional time such as ^{t}XPDLL (MIN) is required.
38. ODT turn-on time MIN is when the device leaves High-Z and ODT resistance begins to turn on. ODT turn-on time maximum is when the ODT resistance is fully on.
39. Half-clock output parameters must be derated by the actual $^{t}ERR_{10PER}$ and $^{t}JIT_{DTY}$ when input clock jitter is present. This results in each parameter becoming larger. The parameters ^{t}ADC (MIN) and ^{t}AOF (MIN) are each required to be derated by subtracting both $^{t}ERR_{10PER}$ (MAX) and $^{t}JIT_{DTY}$ (MAX). The parameters ^{t}ADC (MAX) and ^{t}AOF (MAX) are required to be derated by subtracting both $^{t}ERR_{10PER}$ (MAX) and $^{t}JIT_{DTY}$ (MAX).
40. ODT turn-off time minimum is when the device starts to turn off ODT resistance. ODT turn-off time maximum is when the DRAM buffer is in High-Z.

41. Pulse width of an input signal is defined as the width between the first crossing of $V_{REF(DC)}$ and the consecutive crossing of $V_{REF(DC)}$.
42. Should the clock rate be larger than ^{t}RFC (MIN), an AUTO REFRESH command should have at least one NOP command between it and another AUTO REFRESH command. Additionally, if the clock rate is slower than 40ns (25 MHz), all REFRESH commands should be followed by an AUTO PRECHARGE command.

Command and Address Setup, Hold, and Derating

The total ^{t}IS (setup time) and ^{t}IH (hold time) required is calculated by adding the data sheet ^{t}IS (base) and ^{t}IH (base) values to the Δ^{t}IS and Δ^{t}IH derating values, respectively. Example: ^{t}IS (total setup time) = ^{t}IS (base) + Δ^{t}IS. For a valid transition, the input signal has to remain above/below $V_{IH(AC)}/V_{IL(AC)}$ for some time ^{t}VAC.

Although the total setup time for slow slew rates might be negative (for example, a valid input signal will not have reached $V_{IH(AC)}/V_{IL(AC)}$ at the time of the rising clock transition), a valid input signal is still required to complete the transition and to reach $V_{IH(AC)}/V_{IL(AC)}$.

Setup (^{t}IS) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of $V_{REF(DC)}$ and the first crossing of $V_{IH(AC)min}$. Setup (^{t}IS) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of $V_{REF(DC)}$ and the first crossing of $V_{IL(AC)max}$. If the actual signal is always earlier than the nominal slew rate line between the shaded $V_{REF(DC)}$-to-AC region, use the nominal slew rate for derating value. If the actual signal is later than the nominal slew rate line anywhere between the shaded $V_{REF(DC)}$-to-AC region, the slew rate of a tangent line to the actual signal from the AC level to the DC level is used for derating value.

Hold (^{t}IH) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of $V_{IL(DC)max}$ and the first crossing of $V_{REF(DC)}$. Hold (^{t}IH) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of $V_{IH(DC)min}$ and the first crossing of $V_{REF(DC)}$. If the actual signal is always later than the nominal slew rate line between the shaded DC-to-$V_{REF(DC)}$ region, use the nominal slew rate for derating value. If the actual signal is earlier than the nominal slew rate line anywhere between the shaded DC-to-$V_{REF(DC)}$ region, the slew rate of a tangent line to the actual signal from the DC level to the $V_{REF(DC)}$ level is used for derating value.

Data Setup, Hold, and Derating

The total ^{t}DS (setup time) and ^{t}DH (hold time) required is calculated by adding the data sheet ^{t}DS (base) and ^{t}DH (base) values to the Δ^{t}DS and Δ^{t}DH derating values, respectively. Example: ^{t}DS (total setup time) = ^{t}DS (base) + Δ^{t}DS. For a valid transition, the input signal has to remain above/below $V_{IH(AC)}/V_{IL(AC)}$ for some time ^{t}VAC.

Although the total setup time for slow slew rates might be negative (for example, a valid input signal will not have reached $V_{IH(AC)}/V_{IL(AC)}$) at the time of the rising clock transition), a valid input signal is still required to complete the transition and to reach $V_{IH}/V_{IL(AC)}$.

Setup (^{t}DS) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of $V_{REF(DC)}$ and the first crossing of $V_{IH(AC)min}$. Setup (^{t}DS) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of $V_{REF(DC)}$ and the first crossing of $V_{IL(AC)max}$. If the actual signal is always earlier than the nominal slew rate line between the shaded $V_{REF(DC)}$-to-AC region, use the nominal slew rate for derating value. If the actual signal is later than the nominal slew rate line anywhere between the shaded $V_{REF(DC)}$-to-AC region, the slew rate of a tangent line to the actual signal from the AC level to the DC level is used for derating value.

Hold (^{t}DH) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of $V_{IL(DC)max}$ and the first crossing of $V_{REF(DC)}$. Hold (^{t}DH) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of $V_{IH(DC)min}$ and the first crossing of $V_{REF(DC)}$. If the actual signal is always later than the nominal slew rate line between the shaded DC-to-$V_{REF(DC)}$ region, use the nominal slew rate for derating value. If the actual signal is earlier than the nominal slew rate line anywhere between the shaded DC-to-$V_{REF(DC)}$ region, the slew rate of a tangent line to the actual signal from the DC-to-$V_{REF(DC)}$ region is used for derating value.
