### 2.5 V/3.3 V 1:5 LVPECL Fanout Buffer

## NB3L853141

## Description

The NB3L853141 is a low skew 1:5 LVPECL Clock fanout buffer designed explicitly for low output skew applications.

The NB3L853141 features a multiplexed input which can be driven by either a differential or single-ended input to allow for the distribution of a lower speed clock along with the high speed system clock.

The SEL pin will select the differential clock inputs, CLK0 \& $\overline{\text { CLK0, }}$, when LOW (or left open and pulled LOW by the internal pull-down resistor). When SEL is HIGH, the single-ended CLK1 input is selected.

The common enable $(\overline{\mathrm{EN}})$ is synchronous so that the outputs will only be enabled/disabled when they are already in the LOW state. This avoids any chance of generating a runt clock pulse when the device is enabled/disabled as can happen with an asynchronous control. The internal flip flop is clocked on the falling edge of the input clock, therefore, all associated specification limits are referenced to the negative edge of the clock input.

## Features

- 700 MHz Maximum Clock Output Frequency
- CLK0 and $\overline{\text { CLK0 }}$ can Accept Differential LVPECL, LVDS, HCSL, LVHSTL, SSTL, LVCMOS
- CLK1 can Accept LVCMOS and LVTTL
- Five Differential LVPECL Clock Outputs
- 1.5 ns Maximum Propagation Delay
- Operating Range: $\mathrm{V}_{\mathrm{CC}}=2.375 \mathrm{~V}$ to 3.8 V
- LVCMOS Compatible Control Inputs
- Selectable Differential or LVCMOS Clock Inputs
- Synchronous Clock Enable
- 30 ps Max. Skew Between Outputs
- $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ Ambient Operating Temperature Range
- TSSOP-20 Package
- These Devices are $\mathrm{Pb}-$ Free, Halogen Free/BFR Free and are RoHS Compliant

## Applications

- Computing and Telecom
- Routers, Servers and Switches
- Backplanes

| $\mathrm{V}_{\text {CMR }}$ | Common Mode Input Voltage; (Note 7) |  | 0.5 | $\mathrm{V}_{\mathrm{CC}}-0.85$ |  |
| $\mathrm{I}_{\mathrm{H}}$ | Input HIGH Current | $\mathrm{V}_{\mathrm{CC}}=\mathrm{V}_{\mathrm{IN}}=3.8 \mathrm{~V} \frac{\mathrm{CLKO}}{\mathrm{CLKO}}$ |  | $\begin{gathered} 150 \\ 5 \end{gathered}$ | $\mu \mathrm{A}$ |
| IIL | Input LOW Current | $\mathrm{V}_{\mathrm{CC}}=3.8 \mathrm{~V}, \mathrm{~V}_{\mathrm{IN}}=0 \mathrm{~V} \frac{\text { CLKO }}{\text { CLKO }}$ | $\begin{gathered} \hline-5 \\ -150 \end{gathered}$ |  | $\mu \mathrm{A}$ |

SINGLE-ENDED INPUTS (SEL, EN, CLK1)
$\left.\begin{array}{|c|lr|c|c|c|}\hline \mathrm{V}_{\mathrm{IH}} & \text { Input HIGH Voltage } & \text { SEL, EN } \\ & & \text { CLK1 }\end{array}\right)$

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm.
2. Input and Output parameters vary $1: 1$ with $\mathrm{V}_{\mathrm{CC}}$.
3. LVPECL outputs loaded with $50 \Omega$ to $\mathrm{V}_{\mathrm{CC}}-2 \mathrm{~V}$ for proper operation.
4. $\mathrm{V}_{\mathrm{th}}, \mathrm{V}_{\mathrm{IH}}, \mathrm{V}_{\mathrm{IL}}$, and $\mathrm{V}_{\text {ISE }}$ parameters must be complied with simultaneously.
5. $\mathrm{V}_{\mathrm{th}}$ is applied to the complementary input when operating in single-ended mode.
6. $\mathrm{V}_{I H D}, \mathrm{~V}_{I L D}, \mathrm{~V}_{I D}$ and $\mathrm{V}_{\mathrm{CMR}}$ parameters must be complied with simultaneously.
7. The common mode voltage is defined as $\mathrm{V}_{\mathrm{IH}}$.

Table 6. AC CHARACTERISTICS, $\mathrm{V}_{\mathrm{CC}}=2.375 \mathrm{~V}$ to $3.8 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ (Note 8)

All parameters measured at $\mathrm{f}_{\text {MAX }}$ unless noted otherwise.
The cycle-to-cycle jitter on the input will equal the jitter on the
output. The part does not add jitter
8. Measured using a $\mathrm{V}_{\text {INPPmin }}$ source, Reference Duty Cycle $=50 \%$ duty cycle clock source. All output loading with external $50 \Omega$ to $\mathrm{V}_{\mathrm{CC}}-2 \mathrm{~V}$.
9. Measured from the differential input crossing point to the differential output crossing point.
10. Measured from $\mathrm{V}_{\mathrm{CC}} / 2$ input crossing point to the differential output crossing point.
11. Defined as skew between outputs at the same supply voltage and with equal load conditions. Measured at the output differential cross points.
12. Defined as skew between outputs on different devices operating at the same supply voltages and with equal load conditions. Using the same type of inputs on each device, the outputs are measured at the differential cross points.
13. Output voltage swing is a single-ended measurement operating in differential mode.
14. Input voltage swing is a single-ended measurement operating in differential mode.

The above phase noise data was captured using Agilent E5052A/B. The data displays the input phase noise and output phase noise used to calculate the additive phase jitter at a specified integration range. The RMS Phase Jitter contributed by the device (integrated between 12 kHz and 20 MHz ) is 40.3 fs .

The additive phase jitter performance of the fanout buffer is highly dependent on the phase noise of the input source.

To obtain the most accurate additive phase noise measurement, it is vital that the source phase noise be
notably lower than that of the DUT. If the phase noise of the source is greater than the device under test output, the source noise will dominate the additive phase jitter calculation and lead to an artificially low result for the additive phase noise measurement within the integration range. The Figure above is a good example of the NB3L853141 source generator phase noise having a significantly higher floor such that the DUT output results in an additive phase jitter of 40.3 fs .

$$
\begin{aligned}
& \text { RMS addititive jitter }=\sqrt{\text { RMS phase jitter of output }^{2}-\text { RMS phase jitter of input }}{ }^{2} \\
& \qquad 40.3 \mathrm{fs}=\sqrt{129.56 \mathrm{fs}^{2}-123.13 \mathrm{fs}^{2}}
\end{aligned}
$$
