Octal D flip–flop 74F273A

FEATURES

- High impedance inputs for reduced loading (20µA in Low and High states)
- Ideal buffer for MOS microprocessor or memory
- Eight edge–triggered D–type flip–flops
- Buffered common clock
- Buffered asynchronous Master Reset
- See 74F377A for clock enable version
- See 74F373 for transparent latch version
- See 74F374 for 3–State version

DESCRIPTION

The 74F273 has eight edge–triggered D–type flip–flops with individual D inputs and Q outputs. The common buffered Clock (CP) and Master Reset ($\overline{MR}$) inputs load and reset (clear) all flip–flops simultaneously.

The register is fully edge–triggered. The state of each D input, one setup time before the Low–to–High clock transition, is transferred to the corresponding flip–flop's Q output.

All outputs will be forced Low independently of Clock or Data inputs by a Low voltage level on the $\overline{MR}$ input. The device is useful for applications where the true output only is required and the CP and $\overline{MR}$ are common to all elements.

NOTES:

1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
2. All typical values are at V_{CC} = 5V, T_{amb} = 25°C.
3. To reduce the effect of external noise during test.
4. Not more than one output should be shorted at a time. For testing I_{OS}, the use of high-speed test apparatus and/or sample-and-hold techniques are preferable in order to minimize internal heating and more accurately reflect operational values. Otherwise, prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} tests should be performed last.

Definitions

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.
