DESCRIPTION

The 74LVT16543A is a high-performance BiCMOS product designed for V_{CC} operation at 3.3V. The device can be used as two 8-bit transceivers or one 16-bit transceiver.

The 74LVT16543A contains two sets of eight D-type latches, with separate control pins for each set. Using data flow from A to B as an example, when the A-to-B Enable ($n\overline{EAB}$) input and the A-to-B Latch Enable ($n\overline{LEAB}$) input are Low, the A-to-B path is transparent.

A subsequent Low-to-High transition of the $n\overline{LEAB}$ signal puts the A data into the latches where it is stored and the B outputs no longer change with the A inputs. With $n\overline{EAB}$ and $n\overline{OEAB}$ both Low, the 3-State B output buffers are active and display the data present at the outputs of the A latches.

Control of data flow from B to A is similar, but using the $n\overline{EBA}$, $n\overline{LEBA}$, and $n\overline{OEBA}$ inputs.

Active bus-hold circuitry is provided to hold unused or floating data inputs at a valid logic level.

NOTES:
1. All typical values are at V_{CC} = 3.3V and .
2. This is the increase in supply current for each input at the specified voltage level other than V_{CC} or GND
3. This parameter is valid for any V_{CC} between 0V and 1.2V with a transition time of up to 10msec. From V_{CC} = 1.2V to V_{CC} = 3.3V ± 0.3V a transition time of 100µsec is permitted. This parameter is valid for T_{amb} = 25°C only.
4. Unused pins at V_{CC} or GND.
5. For valid test results, data must not be loaded into the flip-flops (or latches) after applying power.
6. I_{CCZ} is measured with outputs pulled to V_{CC} or GND.
7. This is the bus hold overdrive current required to force the input to the opposite logic state.
