## Quadruple bilateral switches

## DESCRIPTION

The HEF4066B has four independent bilateral analogue switches (transmission gates). Each switch has two input/output terminals (Y/Z) and an active HIGH enable input ( E ). When E is connected to $\mathrm{V}_{\mathrm{DD}}$ a low impedance bidirectional path between Y and Z is established ( ON condition). When E is connected to $\mathrm{V}_{\text {SS }}$ the switch is
disabled and a high impedance between Y and Z is established (OFF condition).

The HEF4066B is pin compatible with the HEF4016B but exhibits a much lower ON resistance. In addition the ON resistance is relatively constant over the full input signal range.

## NOTE

To avoid drawing $V_{D D}$ current out of terminal $Z$, when switch current flows into terminals $Y$, the voltage drop across the bidirectional switch must not exceed $0,4 \mathrm{~V}$. If the switch current flows into terminal Z , no $\mathrm{V}_{\mathrm{DD}}$ current will flow out of terminals Y , in this case there is no limit for the voltage drop across the switch, but the voltages at Y and Z may not exceed $V_{D D}$ or $V_{S S}$.
