ISO K Line Serial Link Interface

33290

ISO9141 PHYSICAL INTERFACE

The 33290 is a serial link bus interface device designed to provide bi-directional half-duplex communication interfacing in automotive diagnostic applications. It is designed to interface between the vehicle's on-board microcontroller and systems off-board the vehicle via the special ISO K line. The 33290 is designed to meet the Diagnostic Systems ISO9141 specification. The device's K line bus driver's output is fully protected against bus shorts and overtemperature conditions.

The 33290 derives its robustness to temperature and voltage extremes by being built on a SMARTMOS process, incorporating CMOS logic, bipolar/MOS analog circuitry, and DMOS power FETs. Although the 33290 was principally designed for automotive applications, it is suited for other serial communication applications. It is parametrically specified over an ambient temperature range of $-40^oC \leq T_A \leq 125^oC$ and $8.0 \text{ V} \leq V_{BB} \leq 18 \text{ V}$ supply. The economical SO-8 surface-mount plastic package makes the 33290 very cost effective.

Features

- Operates Over Wide Supply Voltage of 8.0 to 18V
- Operating Temperature of -40 to 125°C
- Interfaces Directly to Standard CMOS Microprocessors
- ISO K Line Pin Protected Against Shorts to Ground
- Thermal Shutdown with Hysteresis
- ISO K Line Pin Capable of High Currents
- ISO K Line Can Be Driven with up to 10 nF of Parasitic Capacitance
- 8.0 kV ESD Protection Attainable with Few Additional Components
- Standby Mode: No V_{Bat} Current Drain with V_{DD} at 5.0 V
- Low Current Drain During Operation with V_{DD} at 5.0 V
- Pb-Free Packaging Designated by Suffix Code EF

Notes

2. Device will survive double battery jump start conditions in typical applications for 10 minutes duration, but is not guaranteed to remain within specified parametric limits during this duration.

3. ESD data available upon request.

4. ESD1 testing is performed in accordance with the Human Body Model ($C_{ZAP} = 100$ pF, $R_{ZAP} = 1500 \Omega$), ESD2 testing is performed in accordance with the Machine Model ($C_{ZAP} = 200$ pF, $R_{ZAP} = 0 \Omega$).

5. Nonrepetitive clamping capability at 25°C.

6. Pin soldering temperature limit is for 10 seconds maximum duration. Not designed for immersion soldering. Exceeding these limits may cause malfunction or permanent damage to the device.

TYPICAL APPLICATIONS

INTRODUCTION

The 33290 is a serial link bus interface device conforming to the ISO 9141 physical bus specification. The device was designed for automotive environment usage compliant with On-Board Diagnostic (OBD) requirements set forth by the California Air Resources Board (CARB) using the ISO K line. The device does not incorporate an ISO L line. It provides bi-directional half-duplex communications interfacing from a microcontroller to the communication bus. The 33290 incorporates circuitry to interface the digital translations from 5.0 V microcontroller logic levels to battery level logic and from battery level logic to 5.0 V logic levels. The 33290 is built using Freescale Semiconductor's SMARTMOS process and is packaged in an 8-pin plastic SOIC.

FUNCTIONAL DESCRIPTION

The 33290 transforms 5.0 V microcontroller logic signals to battery level logic signals and visa versa. The maximum data rate is set by the fall time and the rise time. The fall time is set by the output driver. The rise time is set by the bus capacitance and the pull-up resistors on the bus. The fall time of the 33290 allows data rates up to 150 kbps using a 30 percent maximum bit time transition value. The serial link interface will remain fully functional over a battery voltage range of 6.0 to 18 V. The device is parametrically specified over a dynamic V_{BB} voltage range of 8.0 to 18 V.

Required input levels from the microcontroller are ratio-metric with the V_{DD} voltage normally used to power the microcontroller. This enhances the 33290's ability to remain in harmony with the R_X and T_X control input signals of the microcontroller. The R_X and T_X control inputs are compatible with standard 5.0 V CMOS circuitry. For fault-tolerant purposes the T_X input from the microcontroller has an internal passive pull-up to V_{DD}, while the CEN input has an internal passive pull-down to ground.
A pull-up to battery is internally provided as well as an active data pull-down. The internal active pull-down is current-limit-protected against shorts to battery and further protected by thermal shutdown. Typical applications have reverse battery protection by the incorporation of an external 510 Ω pull-up resistor and diode to battery.

Reverse battery protection of the device is provided by using a reverse battery blocking diode ("D" in the Simplified Application Diagram on page 1). Battery line transient protection of the device is provided for by using a 45 V zener and a 500 Ω resistor connected to the V_{BB} source as shown in the same diagram. Device ESD protection from the communication lines exiting the module is through the use of the capacitor connected to the V_{BB} device pin and the capacitor used in conjunction with the 27 V zener connected to the ISO pin.
