# 1 pC Charge Injection, 100 pA Maximum Leakage, +5 V / +3 V, SPDT Analog Switch 

## DESCRIPTION

The DG9431E is a monolithic CMOS switch designed for precision signal switching. The $17 \Omega$ low voltage part exhibits low charge injection over the full signal range, low leakage, low parasitic capacitance, and fast switching.
The DG9431E can switch both analog and digital signals. Each switch conducts equally well in both directions when on, and blocks up to the power supply level when off. Break-before-make switching is guaranteed.
The DG9431E offers 1 nW typical power consumption and 8 kV ESD (HBM), 1 kV ESD (CDM) tolerance. It is ideal for use in low voltage instruments and healthcare devices, fitting the circuits of low voltage ADC and DAC, sample and hold, analog front end gain control, and signal path switching. The DG9431E is available in 6-lead TSOP and 8 -lead SOIC packages.

## Notes

a. Room $=25^{\circ} \mathrm{C}$, Full $=$ as determined by the operating suffix.
b. Typical values are for design aid only, not guaranteed nor subject to production testing.
c. The algebraic convention whereby the most negative value is a minimum and the most positive a maximum, is used in this datasheet.
d. Guarantee by design, nor subjected to production test.
e. $\mathrm{V}_{\mathrm{IN}}=$ input voltage to perform proper function.
f. Difference of min and max values.
g. Guaranteed by 5 V leakage testing, not production tested.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
