

Solid Tantalum Surface Mount Chip Capacitors, Molded Case, High Reliability

PERFORMANCE / ELECTRICAL CHARACTERISTICS

Operating Temperature: -55 °C to +125 °C (above 85 °C, voltage derating is required)

Capacitance Range: $0.1 \mu F$ to $100 \mu F$ Capacitance Tolerance: $\pm 10 \%$, $\pm 20 \%$

Voltage Rating: 4 V_{DC} to 35 V_{DC}

FEATURES

- Suitable for automatic mounting
- MSL level: 1
- · High reliability
- Terminations: 100 % matte tin
- Material categorization: for definitions of compliance please see www.vishav.com/doc?99912

Pho

ROHS COMPLIANT HALOGEN FREE

GREEN
(5-2008)
Available

APPLICATIONS

- Industrial
- Car electronics applications
- Computer-based equipment which is required to offer high reliability

ORDER	ING INF	ORMATION					
TMCH	Α	1C	105	М	TR	(2)	F
TYPE	CASE CODE See Ratings and Case Codes table.	DC VOLTAGE RATING AT +85 °C I 0G = 4.0 V 0J = 7 V (6.3 V) 1A = 10 V 1C = 16 V 1D = 20 V 1E = 25 V 1V = 35 V	CAPACITANCE (µF) I This is expressed in picofarads. The first two digits are the significant figures. The third is the number of zeros to follow.	CAPACITANCE TOLERANCE L K = ± 10 % M = ± 20 %	PACKAGING POLARITY I TR = 7" reel, cathodes close to perforation side	(OPTIONAL) Halogen-free (special order), not applicable for E case	TERMINAL CODE I F = lead (Pb)-free terminations

Revision: 02-Nov-2020 1 Document Number: 40182

Guide for Tantalum Solid Electrolyte Chip Capacitors

INTRODUCTION

Tantalum electrolytic capacitors are the preferred choice in applications where volumetric efficiency, stable electrical parameters, high reliability, and long service life are primary considerations. The stability and resistance to elevated temperatures of the tantalum / tantalum oxide / manganese dioxide system make solid tantalum capacitors an appropriate choice for today's surface mount assembly technology.

Vishay Sprague has been a pioneer and leader in this field, producing a large variety of tantalum capacitor types for consumer, industrial, automotive, military, and aerospace electronic applications.

Tantalum is not found in its pure state. Rather, it is commonly found in a number of oxide minerals, often in combination with Columbium ore. This combination is known as "tantalite" when its contents are more than one-half tantalum. Important sources of tantalite include Australia, Brazil, Canada, China, and several African countries. Synthetic tantalite concentrates produced from tin slags in Thailand, Malaysia, and Brazil are also a significant raw material for tantalum production.

Electronic applications, and particularly capacitors, consume the largest share of world tantalum production. Other important applications for tantalum include cutting tools (tantalum carbide), high temperature super alloys, chemical processing equipment, medical implants, and military ordnance.

Vishay Sprague is a major user of tantalum materials in the form of powder and wire for capacitor elements and rod and sheet for high temperature vacuum processing.

THE BASICS OF TANTALUM CAPACITORS

metals form crystalline oxides which non-protecting, such as rust on iron or black oxide on copper. A few metals form dense, stable, tightly adhering, electrically insulating oxides. These are the so-called "valve" metals and include titanium, zirconium, niobium, tantalum, hafnium, and aluminum. Only a few of these permit the accurate control of oxide thickness by electrochemical means. Of these, the most valuable for the electronics industry are aluminum and tantalum.

Capacitors are basic to all kinds of electrical equipment, from radios and television sets to missile controls and automobile ignitions. Their function is to store an electrical charge for later use.

Capacitors consist of two conducting surfaces, usually metal plates, whose function is to conduct electricity. They are separated by an insulating material or dielectric. The dielectric used in all tantalum electrolytic capacitors is tantalum pentoxide.

Tantalum pentoxide compound possesses high-dielectric strength and a high-dielectric constant. As capacitors are being manufactured, a film of tantalum pentoxide is applied to their electrodes by means of an electrolytic process. The film is applied in various thicknesses and at various voltages and although transparent to begin with, it takes on different colors as light refracts through it. This coloring occurs on the tantalum electrodes of all types of tantalum capacitors.

Rating for rating, tantalum capacitors tend to have as much as three times better capacitance / volume efficiency than aluminum electrolytic capacitors. An approximation of the capacitance / volume efficiency of other types of capacitors may be inferred from the following table, which shows the dielectric constant ranges of the various materials used in each type. Note that tantalum pentoxide has a dielectric constant of 26, some three times greater than that of aluminum oxide. This, in addition to the fact that extremely thin films can be deposited during the electrolytic process mentioned earlier, makes the tantalum capacitor extremely efficient with respect to the number of microfarads available per unit volume. The capacitance of any capacitor is determined by the surface area of the two conducting plates, the distance between the plates, and the dielectric constant of the insulating material between the plates.

COMPARISON OF CAPACITOR DIELECTRIC CONSTANTS					
DIELECTRIC	e DIELECTRIC CONSTANT				
Air or vacuum	1.0				
Paper	2.0 to 6.0				
Plastic	2.1 to 6.0				
Mineral oil	2.2 to 2.3				
Silicone oil	2.7 to 2.8				
Quartz	3.8 to 4.4				
Glass	4.8 to 8.0				
Porcelain	5.1 to 5.9				
Mica	5.4 to 8.7				
Aluminum oxide	8.4				
Tantalum pentoxide	26				
Ceramic	12 to 400K				

In the tantalum electrolytic capacitor, the distance between the plates is very small since it is only the thickness of the tantalum pentoxide film. As the dielectric constant of the tantalum pentoxide is high, the capacitance of a tantalum capacitor is high if the area of the plates is large:

$$C = \frac{eA}{t}$$

where

C = capacitance

e = dielectric constant

A = surface area of the dielectric

t = thickness of the dielectric

Tantalum capacitors contain either liquid or solid electrolytes. In solid electrolyte capacitors, a dry material (manganese dioxide) forms the cathode plate. A tantalum lead is embedded in or welded to the pellet, which is in turn connected to a termination or lead wire. The drawings show the construction details of the surface mount types of tantalum capacitors shown in this catalog.

Revision: 21-Sep-2020 Document Number: 40218

SOLID ELECTROLYTE TANTALUM CAPACITORS

Solid electrolyte capacitors contain manganese dioxide, which is formed on the tantalum pentoxide dielectric layer by impregnating the pellet with a solution of manganous nitrate. The pellet is then heated in an oven, and the manganous nitrate is converted to manganese dioxide.

The pellet is next coated with graphite, followed by a layer of metallic silver, which provides a conductive surface between the pellet and the leadframe.

Molded chip tantalum capacitor encases the element in plastic resins, such as epoxy materials. After assembly, the capacitors are tested and inspected to ensure long life and reliability. It offers excellent reliability and high stability for consumer and commercial electronics with the added feature of low cost.

Surface mount designs of "Solid Tantalum" capacitors use lead frames as shown in the accompanying drawings.

TANTALUM CAPACITORS FOR ALL DESIGN CONSIDERATIONS

Solid electrolyte designs are the least expensive for a given rating and are used in many applications where their very small size for a given unit of capacitance is of importance. Also important are their good low temperature performance characteristics and freedom from corrosive electrolytes.

Datasheets covering the various types and styles of capacitors for consumer and entertainment electronics and industry applications are available where detailed performance characteristics must be specified.

SOLID TANTALUM CAPACITORS - MOLDED CASE						
SERIES	TMCS	ТМСМ	TMCR	TMCU	TMCP	TMCJ
PRODUCT IMAGE	*			TEST MATE	and	MAJ .
TYPE	Solid tantalum surface mount chip capacitors, molded case					
FEATURES	Standard industrial grade	Standard industrial grade extended range	Low ESR	Low profile	0805 size	0603 size
TEMPERATURE RANGE	-55 °C to +125 °C					
CAPACITANCE RANGE	0.1 μF to 68 μF	0.47 μF to 470 μF	10 μF to 330 μF	0.1 μF to 220 μF	0.1 μF to 47 μF	0.68 μF to 22 μF
VOLTAGE RANGE	4 V to 35 V	2.5 V to 35 V	7 V to 35 V	2.5 V to 35 V	2.5 V to 25 V	2.5 V to 20 V
CAPACITANCE TOLERANCE	± 10 %, ± 20 % ± 20 %				± 20 %	
LEAKAGE CURRENT	0.01 CV or 0.5 μA, whichever is greater					
DISSIPATION FACTOR	4 % to 6 %	4 % to 30 %	6 % to 30 %	4 % to 30 %	6 % to 30 %	20 %
CASE SIZES	A, B, C, E	A, B, C, E	B, C, E	UA, UB	Р	J
TERMINATION FINISH	100 % tin			Case UA: 100 % tin Case UB: Ni / Pd / Au	100 % tin	

SOLID TANTALUM CAPACITORS - MOLDED CASE						
SERIES	тмстх	ТМСН	THC			
PRODUCT IMAGE		1/60	200			
TYPE	Solid tantalum surface mount chip capacitors, molded case					
FEATURES	Built-in fuse	High reliability	High reliability, high temperature +150 °C			
TEMPERATURE RANGE	-55 °C to +125 °C		-55 °C to +150 °C			
CAPACITANCE RANGE	1.0 μF to 68 μF	0.1 μF to 100 μF	0.33 μF to 47 μF			
VOLTAGE RANGE	10 V to 35 V	4 V to 35 V	10 V to 35 V			
CAPACITANCE TOLERANCE	± 10 %, ± 20 %					
LEAKAGE CURRENT	0.01 CV or 0.5 μA, whichever is greater 0.005 CV or 0.25 μΑ		whichever is greater			
DISSIPATION FACTOR	4 % to 6 %	4 % to 8 %	4 % to 6 %			
CASE SIZES	B, C, E, F	A, B, C, E, P	A, B, C, E			
TERMINATION FINISH	100 % tin					

PEAK PACKAGE BODY TEMPERATURE (Tp)				
CACE CODE	PEAK PACKAGE BODY TEMPERATURE (Tp)			
CASE CODE	LEAD (Pb)-FREE PROCESS			
J, P, UA, A, UB, B, C	260 °C			
E, F	250 °C			

GUIDE TO APPLICATION

 AC Ripple Current: the maximum allowable ripple current shall be determined from the formula:

$$I_{RMS} = \sqrt{\frac{P}{R_{ESR}}}$$

where.

P = power dissipation in W at +25 °C as given in the tables in the product datasheets.

R_{ESR} = the capacitor equivalent series resistance at the specified frequency.

2. **AC Ripple Voltage:** the maximum allowable ripple voltage shall be determined from the formula:

$$V_{RMS} = Z \sqrt{\frac{P}{R_{ESR}}}$$

or, from the formula:

$$V_{RMS} = I_{RMS} \times Z$$

where.

P = power dissipation in W at +25 °C as given in the tables in the product datasheets.

R_{ESR} = The capacitor equivalent series resistance at the specified frequency.

Z = The capacitor impedance at the specified frequency.

2.1 The tantalum capacitors must be used in such a condition that the sum of the working voltage and ripple voltage peak values does not exceed the rated voltage as shown in figure below.

3. **Temperature Derating:** power dissipation is affected by the heat sinking capability of the mounting surface. If these capacitors are to be operated at temperatures above +25 °C, the permissible ripple current (or voltage) shall be calculated using the derating coefficient as shown in the table below:

MAXIMUM RIPPLE CURRENT TEMPERATURE DERATING FACTOR				
TEMPERATURE	TMC			
≤ 25 °C	1.0			
85 °C	0.9			
105 °C	0.65			
125 °C	0.4			

4. Reverse Voltage: the capacitors are not intended for use with reverse voltage applied. If the application of a reverse voltage is unavoidable, it must not exceed the following values:

At 25 °C: 10 % of the rated voltage or 1 V, whichever is smaller.

At 85 $^{\circ}$ C: 5 % of the rated voltage or 0.5 V, whichever is smaller.

5. Mounting Precautions:

5.1 Limit Pressure on Capacitor Installation with Mounter: pressure must not exceed 4.9 N with a tool end diameter of 1.5 mm when applied to the capacitors using an absorber, centering tweezers, or similar (maximum permitted pressurization time: 5 s). An excessively low absorber setting position would result in not only the application of undue force to the capacitors but capacitor and other component scattering, circuit board wiring breakage, and / or cracking as well, particularly when the capacitors are mounted together with other chips having a height of 1 mm or less.

5.2 Flux Selection

- 5.2.1 Select a flux that contains a minimum of chlorine and amine.
- 5.2.2 After flux use, the chlorine and amine in the flux remain must be removed.
- 5.3 Cleaning After Mounting: the following solvents are usable when cleaning the capacitors after mounting. Never use a highly active solvent.
 - Halogen organic solvent (HCFC225, etc.)
 - Alcoholic solvent (IPA, ethanol, etc.)
 - Petroleum solvent, alkali saponifying agent, water, etc.

Circuit board cleaning must be conducted at a temperature of not higher than 50 °C and for an immersion time of not longer than 30 minutes. When an ultrasonic cleaning method is used, cleaning must be conducted at a frequency of 48 kHz or lower, at a vibrator output of 0.02 W/cm³, at a temperature of not higher than 40 °C, and for a time of 5 minutes or shorter.

Notes

- Care must be exercised in cleaning process so that the mounted capacitor will not come into contact with any cleaned object or the like or will not get rubbed by a stiff brush or similar. If such precautions are not taken particularly when the ultrasonic cleaning method is employed, terminal breakage may occur
- When performing ultrasonic cleaning under conditions other than stated above, conduct adequate advance checkout
