

Micropower Rail-to-Rail Op Amp and Reference

FEATURES

- **Guaranteed Operation at 1.2V**
- **Op Amp and Reference on Single Chip**
- **Micropower: 130 μ A Supply Current**
- Industrial Temperature Range SO-8 Packages
- Rail-to-Rail Output
- High Output Current: 20mA Min
- Output Drives 1000pF
- Capable of Floating Mode Operation
- Specified for 5V and \pm 5V Supplies
- Low Reference Drift: 30ppm/ $^{\circ}$ C
- Industry Standard LM10 Pinout

APPLICATIONS

- Battery- or Solar-Powered Systems
 - Portable Instrumentation
 - Sensor Conditioning
- Precision Current Regulators
- Precision Voltage Regulators
- Battery Level Indicator
- Thermocouple Transmitter

DESCRIPTION

The LT[®]1635 is a new analog building block that includes a rail-to-rail output op amp, a precision reference and reference buffer. The device operates from supplies as low as a single 1.2V or up to \pm 5V, yet it consumes only 130 μ A of supply current.

The input common mode range of the op amp includes ground and incorporates phase reversal protection to prevent false outputs from occurring when the input is below the negative supply. The rail-to-rail output stage can swing to within 15mV of each rail with no load and can swing to within 250mV of each rail while delivering 10mA of output current. The gain bandwidth of the op amp is 175kHz and it is unity-gain stable with up to 1000pF load capacitance.

The 0.2V reference is referred to V^- and includes a buffer amplifier to enhance flexibility. The reference and buffer combine to achieve a drift of 30ppm/ $^{\circ}$ C, a line regulation of 20ppm/V and a load regulation of 150ppm/mA.

The LT1635 is available in 8-pin PDIP and SO packages, and has the industry standard LM10 pinout.

LT, LTC and LT are registered trademarks of Linear Technology Corporation.

TYPICAL APPLICATION

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: The LT1635C is guaranteed to operate over the commercial temperature range of 0°C to 70°C . It is designed, characterized and expected to meet these extended temperature limits, but is not tested at -40°C and 85°C . The LT1635I is guaranteed to meet the industrial temperature range.

Note 3: The LT1635 op amp operates on a 1.2V supply over the full industrial temperature range with an input common mode voltage of 0V to 0.2V. The minimum supply voltage for the reference to operate properly over this temperature range is 1.3V.

Note 4: This parameter is not 100% tested. Temperature coefficient is measured by dividing the change in output voltage by specified temperature range.

Note 5: Shunt gain defines the operation in floating applications when the output is connected to the V^+ terminal and input common mode is referred to V^- .

Note 6: If part is stored outside of the specified temperature range, the output may shift due to hysteresis.

BLOCK DIAGRAM

APPLICATIONS INFORMATION

The LT1635 is fully specified with $V^+ = 5V$, $V^- = 0V$ and $V_{CM} = 2.5V$. The op amp offset voltage is internally trimmed to a minimum value at these supply voltages. A unique feature of this device is that it operates from a single 1.2V supply up to $\pm 5V$. A full set of specifications is provided at $\pm 5V$ supply voltages. The positive supply pin of the LT1635 should be bypassed with a small capacitor (about $0.1\mu F$), as well as the negative supply pin when using split supplies.

Op Amp

The LT1635 is fully specified for single supply operation, i.e., when the negative supply is $0V$. Input common mode range of the op amp includes ground and the output swings within a few millivolts of ground while sinking current. The input stage of the op amp incorporates phase reversal protection to prevent false outputs from occurring when the input is below the negative supply. Protective resistors have been included in the input leads so that current does not become excessive when the inputs are forced below the negative supply.

The op amp also includes an offset nulling feature, this is accomplished by connecting the BALANCE pin (Pin 5) to a variable voltage derived from the reference output. The offset adjust range is asymmetrical, typically $-2mV$ to $8mV$. At room temperature the input offset voltage of the LT1635 is within the null range, thus the offset voltage can be adjusted to zero. Figure 1 shows the standard offset adjustment.

Figure 1. Standard Offset Adjustment

Output

The output voltage swing of the LT1635 is a function of input overdrive as shown in the typical performance curves. When monitoring voltages within $15mV$ of either rail, gain

should be taken to keep the output from saturating. For example, a $1mV$ input signal will cause the amplifier to set up in its linear region in the gain 100 configuration as shown in Figure 2a. However, $1mV$ is not enough to make the amplifier function properly in the voltage follower mode (Figure 2b).

Figure 2. Gain 100 Amplifier and Voltage Follower

Distortion

There are two main contributors of distortion in op amps: distortion caused by nonlinear common mode rejection and output crossover distortion as the output transitions from sourcing to sinking current. The common mode rejection ratio of the LT1635 is very good, typically $110dB$. Therefore, as long as the input operates in normal common mode range, there will be very little common mode induced distortion. Crossover distortion will increase as the output load resistance decreases. For the lowest distortion, the LT1635 should be operated with the output always sourcing current.

Reference

The reference of the LT1635 consists of a $200mV$ precision bandgap and a reference amplifier. As shown in the block diagram, the $0.2V$ precision bandgap is referred to V^- and is internally connected to the noninverting input of the reference amplifier. This configuration offers great flexibility in that the reference voltage can be amplified or the reference amplifier can be used as a comparator. Unlike the op amp, the output of the reference amplifier can only swing within $0.8V$ (typ) of the positive rail. To guarantee that the reference amplifier does not saturate over the industrial temperature range, the minimum operating supply should be $1.3V$. The reference amplifier can source $2mA$ of load current and can sink $10\mu A$ over the industrial temperature range.
