2 Overview

The PAN9026 is a dual band 2.4 GHz and 5 GHz 802.11 a/b/g/n Wi-Fi radio module with integrated Bluetooth BR/EDR/LE, specifically designed for highly integrated and cost-effective applications. The simultaneous and independent operation of the two standards enables high data rates (802.11n) and low-power operation (Bluetooth Low Energy). Integrated power management, a fast dual-core CPU, 802.11i security standard support, and high-speed data interfaces deliver the performance for the speed, reliability, and quality requirements of next generation products. TX power calibration data and Wi-Fi/Bluetooth system parameters are pre-stored on the one-time-programmable memory of the PAN9026 during production at Panasonic. This simplifies passing the certification process for PAN9026 customers. Furthermore, the module reduces design, test, and calibration effort resulting in reduced time-to-market compared to discrete solutions.

Integrating Wi-Fi and Bluetooth wireless connectivity allows applications such as Smart Energy and home gateways to manage multiple devices and appliances. The combination of Wi-Fi and Bluetooth provides the highest flexibility for connectivity.

2.7 Coexistence

The implemented coexistence framework is based on the IEEE 802.15.2 recommended practice Packet Traffic Arbitration (PTA) scheme and the Bluetooth Special Interest Group (Bluetooth SIG) Core Specification Volume 7 (Wireless Coexistence Volume).

2.7.1 WLAN/Bluetooth Channel Information Exchange

Since Bluetooth and IEEE 802.11 b/g/n WLAN use the same 2.4 GHz frequency band, each can cause interference with another. The level of interference depends on the respective frequency channel used by Bluetooth and WLAN (other factors can impact interference, like Tx power and Rx sensitivity of the device).

In a system with both Bluetooth and WLAN, the common host receives information about WLAN channel usage and passes the information to the Bluetooth device. For Bluetooth 1.2 devices with Adaptive Frequency Hopping (AFH) enabled, the Bluetooth device can block channel usage that overlaps the WLAN channel in use.

When the Bluetooth device avoids all channels used by the WLAN, the impact of interference is reduced, but not completely eliminated. For Bluetooth 1.1 devices, the Bluetooth device cannot block WLAN channel usage. In this case, a Bluetooth Coexistence Arbiter (BCA) scheme at MAC level is required. The BCA scheme can also be used with Bluetooth 1.2 devices to further reduce the impact of interference to a minimum.

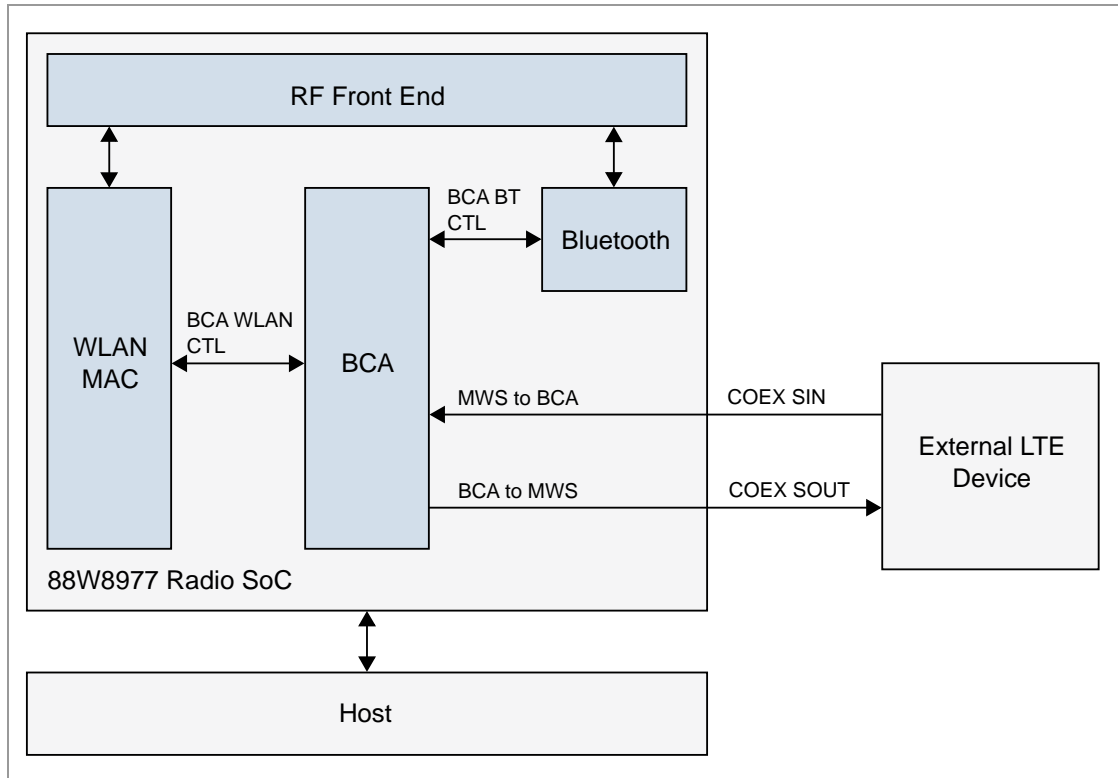

2.7.2 External Mobile Wireless System (LTE/ZigBee[®]) and BCA Exchange

Based on the Bluetooth SIG Wireless Coexistence Volume, the device supports a Wireless Coexistence Interface 2 (WCI-2) protocol for WLAN and Bluetooth coexistence with an external Mobile Wireless System (MWS), such as a Long Term Evolution (LTE) or ZigBee device.

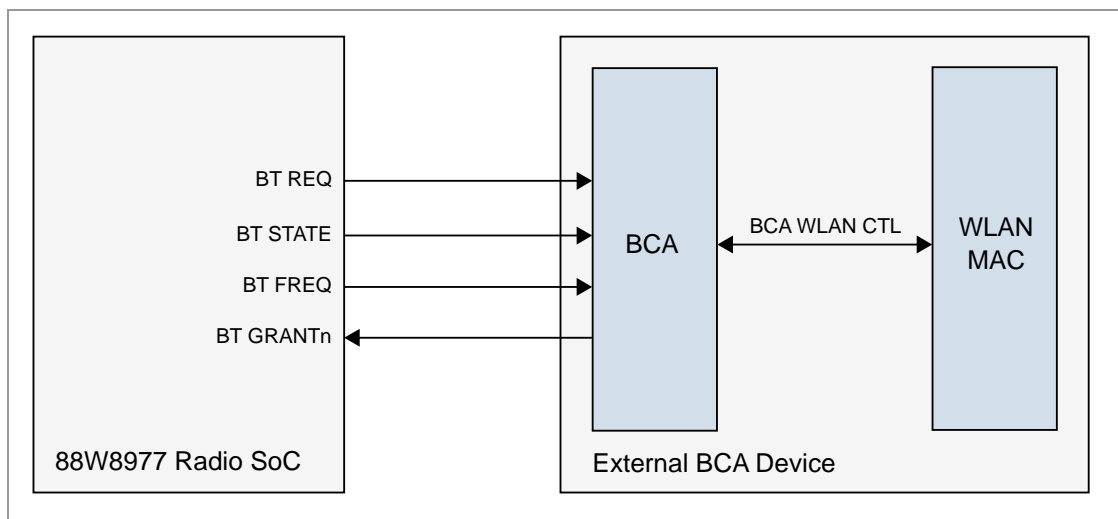

WCI-2 is a 2-wire transport interface. An internal coexistence is used to exchange request/grant with the BCA.

2.7.3 System Configuration

External MWS Device

External BCA Device

2.7.4 WCI-2 Interface

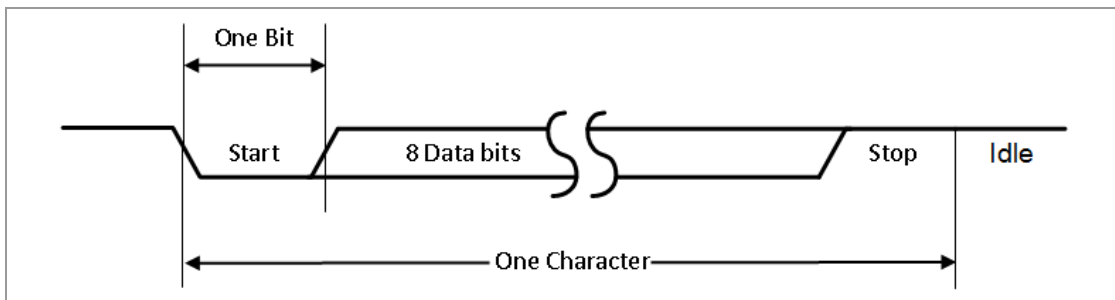

The coexistence interface includes a Mobile Wireless System (MWS) transport controller to accommodate a 2-wire, UART-based serial transport interface. This interface is a standard full-duplex UART (TXD and RXD) carrying logical signals framed as UART characters. In addition, it allows support of multiple logical channels.

Interface Signals

C4	COEX_SIN	RXD	Input	Serial data from external MWS device
D4	COEX_SOUT	TXD	Output	Serial data to external MWS device

Signal Waveform Format

The messaging is based on a standard UART format. The UART signals should be connected like a null-modem. For example, the local TXD connected to the remote RXD and vice versa.

Interface Transport Settings

Item	Range	Comment
Baudrate	921 600 to 4 000 000	Baud

Real-Time Signaling Message

The real-time signaling message is used to transport real-time signals over the 2-wire transport interface.

The real-time signaling message conveys the real-time signals (Bluetooth Core Specification, Volume 7, Part A) in one message. The time reference point for the real-time signaling message is the end of message bit 5 (transition to stop bit).

Defined real-time signaling messages include:

- Coexistence Controller to MWS device
- MWS device to Coexistence Controller

If the signal is not transmitted within four UART character periods, the device is considered asleep.</p> <p>If the receiving device's transport interface is not awake it shall not send a real-time message.</p> <p>Bluetooth initiated:</p> <p>If the MWS is currently scanning or has an ongoing inactivity duration, the MWS shall send a frequency scan message or an inactivity duration message after transmitting the real-time message.</p> <p>If the receiving device's transport interface is not awake it shall not send a frequency scan or inactivity duration message.</p>

Transparent Data Message

The transport control messages can modify the state and request state information of the MWS coexistence interface.

Message	MSG[0]	MSG[1]	MSG[2]	MSG[3]	MSG[4]
Transparent Data Message	NIBBLE_POSITION	DATA[0]/ DATA[4]	DATA[1]/ DATA[5]	DATA[2]/ DATA[6]	DATA[3]/ DATA[7]

Signal Name	Description
NIBBLE_POSITION	<p>0 = least significant nibble</p> <p>1 = most significant nibble</p>
DATA[n]; n=0 ... 7	Data bits of the message octet

MWS Inactivity Duration Message

The inactivity duration messages is used to send the signal MWS_INACTIVITY_DURATION from the MWS device to the Coexistence Controller.

Message	MSG[0]	MSG[1]	MSG[2]	MSG[3]	MSG[4]
MWS Inactivity Duration Message	DURATION[0]	DURATION[1]	DURATION[2]	DURATION[3]	DURATION[4]

The idle duration is encoded in 5 bits given by the formula:

$$\text{Inactivity_Duration} = \text{DURATION} * 5 \text{ ms}$$

Inactivity durarations smaller than 5 ms are not communicated.

If all bits are set to 1 the inactivity duration is infinite. If all bits are set to 0, signal MWS_RX, or signal MWS_TX are set to 1, the inactivity period ends.

MWS Scan Frequency Offset Message

The MWS scan frequency offset message is used to send the signal MWS_SCAN_FREQUENCY_OFFSET from the MWS device to the Coexistence Controller.

Message	MSG[0]	MSG[1]	MSG[2]	MSG[3]	MSG[4]
MWS Scan Frequency Offset	BAND	FREQ[0]	FREQ [1]	FREQ [2]	FREQ [3]

The RF scan frequency is encoded in 5 bits given by the formula:

$$\text{RF_FREQ_OFFSET} = \text{FREQ} * 10 \text{ MHz}$$

If BAND is set to 0 the signal RF_FREQ_OFFSET is the negative value from the lower edge of the ISM band. If BAND is set to 1, signal RF_FREQ_OFFSET is the positive value from the top edge of the ISM band.

FREQ set to all 0 indicates the end of the scan period.

Decision Policies	<p>System configuration is a major consideration when planning decision policies. The configuration governs how RF paths are shared and how much interference will occur. Interference combinations include:</p> <ul style="list-style-type: none"> - WLAN TX and Bluetooth TX - WLAN TX and Bluetooth RX - WLAN RX and Bluetooth TX - WLAN RX and Bluetooth RX <p>Interference combinations where WLAN and Bluetooth share the same antenna:</p> <ul style="list-style-type: none"> - WLAN TX and Bluetooth TX share the same antenna, the decision matrix allows either WLAN or Bluetooth TX (both OOB and IB), based on relative packet priorities. - WLAN TX and Bluetooth RX (both OOB and IB) have sizable interference impacts on Bluetooth RX, the decision matrix grants or denies WLAN TX based on relative packet priorities. - WLAN RX and Bluetooth TX (both OOB and IB) have sizable interference impacts on WLAN RX, the decision matrix grants or denies Bluetooth TX based on relative packet priorities. - WLAN RX and Bluetooth RX (both OOB and IB) have no impact on each other, the decision matrix grants both. <p>Interference combinations where WLAN and Bluetooth have their own antenna:</p> <ul style="list-style-type: none"> - WLAN TX and Bluetooth TX in OOB situation have little interference impact on each other, the decision matrix grants both. - WLAN TX and Bluetooth TX in IB have sizable interference impact on each other, the decision matrix allows either WLAN or Bluetooth TX, based on relative packet priorities. - WLAN TX and Bluetooth RX in OOB situation have little interference impact on each other, the decision matrix grants both provided there is enough antenna isolation between WLAN and Bluetooth antenna. - WLAN TX and Bluetooth RX in IB situation have sizable interference impact on Bluetooth RX, the decision matrix grants or denies WLAN TX based on relative packet priorities. - WLAN RX and Bluetooth TX in OOB situation have little interference impact on each other, the decision matrix grants both provided there is enough antenna isolation between WLAN and Bluetooth antenna. - WLAN RX and Bluetooth TX in IB situation have sizable interference impact on WLAN RX, the decision matrix grants or denies Bluetooth TX based on relative packet priorities. - WLAN RX and Bluetooth RX (both OOB and IB) have no impact on each other, the decision matrix grants both. <p>For the devices running in a basic shared antenna configuration, the linear switching imposes restrictions on simultaneous transfer. Reasonable policies include:</p> <ul style="list-style-type: none"> - WLAN and Bluetooth are never granted at the same time - Decision matrix grants a device based on relative packet priorities and direction - Priority order: High > Medium High > Medium > Low - For equal priority contention, select one device to win, that optimizes the usage case <p>For the devices running in an enhanced shared antenna configuration, the linear switching imposes restrictions on some simultaneous transfers.</p>

Type	Features
Transaction Stopping	The arbiter allows control of what transfers can be stopped after an initial grant. If allowed, a transaction can be stopped for higher priority request. A transaction stop decision is a function of the decision policies and transaction stopping control. The transaction stopping control is configurable per device and direction.

2.7.6 Bluetooth Capability

Type	Features
Request Schemes	The PTA signals are directly controlled by the hardware to meet timing requirements of the Bluetooth radio. The software controls the type of traffic in priority mode. Mechanism enforced for control include: <ul style="list-style-type: none"> • Selection of certain types of communication always treated as high priority • Selection of individual frames marked with high priority • Real-time signaling of the next slot marked with high priority • Automatic hardware control, based on the grant/denial history of the Bluetooth link
Timing Control	The signal timing scheme PTA is fully programmable relative to the Bluetooth packet timing.

2.7.7 WLAN Capability

Type	Features
Capability	The WLAN device technology uses an internal coexistence interface to exchange request/grant with the BCA. <ul style="list-style-type: none"> • Packet-based request signaling with direction and priority information • 1-bit or 2-bit priority signaling to support four priority levels • Multiple WLAN RX request trigger sources, including early prediction • WLAN TX request cancellation and abort if grant denied or revoked in middle of request • 802.11n A-MPDU treated as single packet
Packet Classification	<ul style="list-style-type: none"> • Programmable mask allows each frame type to be mapped to a priority • Default setting puts response frames (ACK), beacons, and QoS frames as high priority • WLAN TX and RX have separate priority mask
Queue Classification	<ul style="list-style-type: none"> • Programmable mask allows each transmit queue to be mapped to a priority • Queue-based mapping is optional for software-generated frames only

2.7.8 LTE (MWS) Capability

The device supports a Bluetooth SIG WCI-2 MWS coexistence signaling interface. The coexistence logical signaling is designed to enable a standard interface to allow an MWS device and a Coexistence Controller to exchange information and support cooperative coexistence.

The WCI-2 signals carry time-critical information such as the start point of an MWS frame. The logical coexistence signaling architecture also includes transparent data messaging and vendor specific data messaging mechanism to enable passing information to and from the collocated MWS device and Coexistence Controller when long latency (tens of milliseconds) cannot be tolerated.

For further information please refer to [⇒ 2.7.4 WCI-2 Interface](#).

Coexistence Signals

The logical signals assist in time alignment, protecting MWS from interference and maximizing the usability of the Bluetooth radio.

2.7.9 ZigBee (MWS) Coexistence Capability

ZigBee is based on the IEEE 802.15.4 standard and it is used by a suite of communication protocols to create Personal Area Networks (PANs) supporting home automation, lighting control, etc. ZigBee radios operate in the 2.4 GHz ISM band worldwide. Unlike Bluetooth, the ZigBee specification does not use AFH. When coexisting with WLAN/Bluetooth in the 2.4 GHz band, it is important to avoid co-channel (IB) operation of these radios.

The device re-uses the MWS coexistence interface to support ZigBee coexistence. The coexistence logical signaling is used to allow a ZigBee device and a WLAN/Bluetooth combined device to exchange information and support cooperative coexistence.

Coexistence Signals

The logical signals used for ZigBee and WLAN/Bluetooth coexistence are a subset of the LTE coexistence signaling. Considering the lower data rate of ZigBee packets, a lower baud rate may be chosen for the 2-wire UART physical interface. The BCA supports 3-way arbitration among ZigBee/WLAN/Bluetooth requests.

- PCM master
- PCM slave

When in PCM master mode, the interface generates a 2 MHz or a 2.048 MHz signal PCM_CLK and a 8 kHz signal PCM_SYNC signal. An alternative PCM master mode is available that uses an externally generated signal PCM_CLK, but still generates the 8 kHz signal PCM_SYNC. The external signal PCM_CLK must have a frequency that is an integer multiple of 8 kHz. Supported frequencies are in the 512 kHz to 4 MHz range.

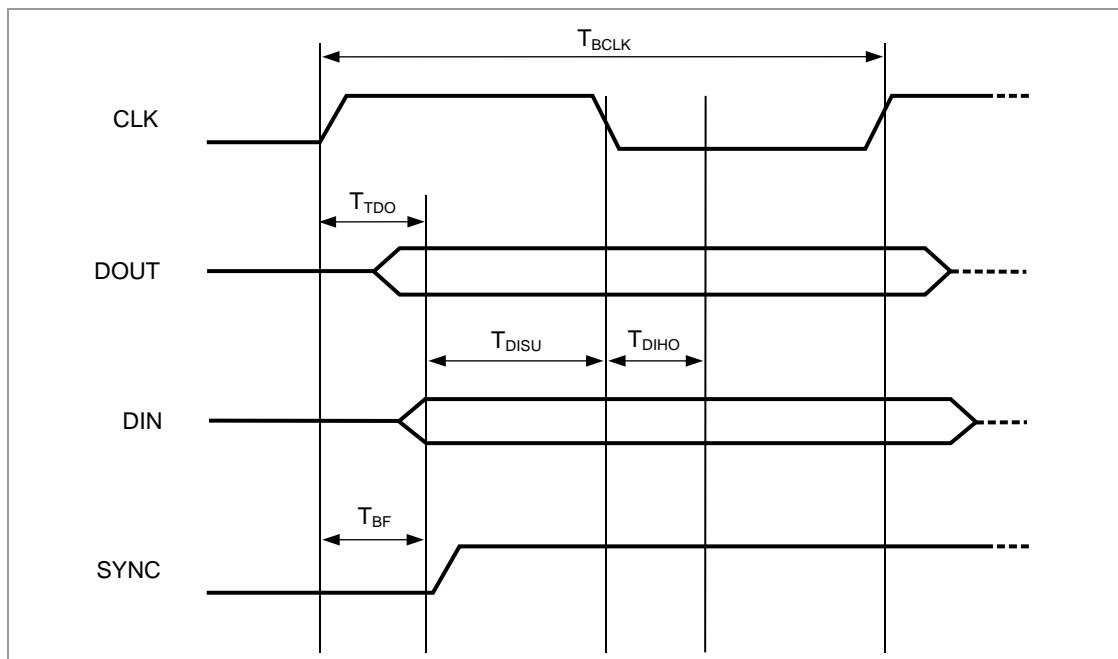

When in PCM slave mode, the interface has both signal PCM_CLK and signal PCM_SYNC as inputs, thereby letting another unit on the PCM bus generate the signals.

The PCM interface consists of up to four PCM slots (time-devided) preceded by a PCM sync signal. Each PCM slot can be either 8 bits or 16 bits wide. The slots can be separated in time, but they are not required to follow immediately after another. The timing is relative to signal PCM_SYNC.

4.6 Recommended Soldering Profile

- Reflow permissible cycle: 2

- The soldering profiles should be adhered to in order to prevent electrical or mechanical damage
- Soldering profile assumes lead-free soldering

5 Cautions

Failure to follow the guidelines set forth in this document may result in degrading of the module functions and damage to the module.

5.1 Design Notes

Radio requires a RF ground plane on the rest of the Printed Circuit Board (PCB) area. This can be located on any layer of the PCB. For best performance, extend the RF ground plane the entire length of your board. Connect all ground pins and do not notch the ground plane around the module. The bottom of the module is grounded. So be careful of vias or conductive traces located under the modules that are not soldered masked to prevent shorting.

Keep metallic components, connectors, copper traces, internal layers, and ground planes away from the antenna area in 3D space!

1. Follow the conditions written in this specification, especially the control signals of this module.
2. The supply voltage should abide by the maximum ratings (⇒ [4.2 Absolute Maximum Ratings](#)).
3. The supply voltage must be free of AC ripple voltage (for example from a battery or a low noise regulator output). For noisy supply voltages, provide a decoupling circuit (for example a ferrite in series connection and a bypass capacitor to ground of at least 47 μ F directly at the module).
4. This module should not be mechanically stressed when installed.
5. Keep this module away from heat. Heat is the major cause of decreasing the life time of these modules.
6. Avoid assembly and use of the target equipment in conditions where the module temperature may exceed the maximum tolerance.
7. Keep this module away from other high frequency circuits.
8. Refer to the recommended pattern when designing a board.

5.2 Installation Notes

1. Reflow soldering is possible twice based on the conditions set forth in ⇒ [4.6 Recommended Soldering Profile](#). Set up the temperature at the soldering portion of this module according to this reflow profile.
2. Carefully position the module so that the heat will not burn into printed circuit boards or affect other components that are susceptible to heat.
3. Carefully locate the module, to avoid an increased temperature caused by heat generated by neighboring components.

4. If a vinyl-covered wire comes into contact with the module, the wire cover will melt and generate toxic gas, damaging the insulation. Never allow contact between a vinyl cover and these modules to occur.
5. This module should not be mechanically stressed or vibrated when reflowed.
6. To repair the board by hand soldering, follow the conditions set forth in this chapter.
7. Do not wash this product.
8. Pressing on parts of the metal cover or fastening objects to the metal will cause damage to the module.

5.3 Usage Condition Notes

1. Take measures to protect the module against static electricity.
If pulses or transient loads (a large load, which is suddenly applied) are applied to the modules, check and evaluate their operation before assembly of the final products.
2. Do not use dropped modules.
3. Do not touch, damage, or soil the pins.
4. Follow the recommended condition ratings about the power supply applied to this module.
5. Electrode peeling strength: Do not apply a force of more than 4.9 N in any direction on the soldered module.
6. Pressing on parts of the metal cover or fastening objects to the metal cover will cause damage.
7. These modules are intended for general purpose and standard use in general electronic equipment, such as home appliances, office equipment, information, and communication equipment.

5.4 Storage Notes

1. The module should not be stressed mechanically during storage.
2. Do not store these modules in the following conditions or the performance characteristics of the module, such as RF performance will be adversely affected:
 - Storage in salty air or in an environment with a high concentration of corrosive gas, such as Cl₂, H₂S, NH₃, SO₂, or NO_x,
 - Storage in direct sunlight,
 - Storage in an environment where the temperature may be outside the range of 5 °C to 35 °C, or where the humidity may be outside the 45 % to 85 % range,
 - Storage of the modules for more than one year after the date of delivery storage period: Please check the adhesive strength of the embossed tape and soldering after 6 months of storage.
3. Keep this module away from water, poisonous gas, and corrosive gas.
4. This module should not be stressed or shocked when transported.

5. Follow the specification when stacking packed crates (max. 10).

5.5 Safety Cautions

These specifications are intended to preserve the quality assurance of products and individual components.

Before use, check and evaluate the operation when mounted on your products. Abide by these specifications without deviation when using the products. These products may short-circuit. If electrical shocks, smoke, fire, and/or accidents involving human life are anticipated when a short circuit occurs, provide the following failsafe functions as a minimum:

1. Ensure the safety of the whole system by installing a protection circuit and a protection device.
2. Ensure the safety of the whole system by installing a redundant circuit or another system to prevent a single fault causing an unsafe status.

5.6 Other Cautions

1. Do not use the module for other purposes than those listed in section [⇒ 5.3 Usage Condition Notes](#)
2. Be sure to provide an appropriate fail-safe function on your product to prevent any additional damage that may be caused by the abnormal function or the failure of the module.
3. This module has been manufactured without any ozone chemical controlled under the Montreal Protocol.
4. These modules are not intended for use under the special conditions shown below. Before using these modules under such special conditions, carefully check their performance and reliability under the said special conditions to determine whether or not they can be used in such a manner:
 - In liquid, such as water, salt water, oil, alkali, or organic solvent, or in places where liquid may splash,
 - In direct sunlight, outdoors, or in a dusty environment,
 - In an environment where condensation occurs,
 - In an environment with a high concentration of harmful gas (e.g. salty air, HCl, Cl₂, SO₂, H₂S, NH₃, and NO_x).
5. If an abnormal voltage is applied due to a problem occurring in other components or circuits, replace these modules with new modules, because they may not be able to provide normal performance even if their electronic characteristics and appearances appear satisfactory.

6.3.1 Radio Equipment Directive

The Radio Equipment Directive 2014/53/EU (RED) establishes a regulatory framework for placing radio equipment on the market. It ensures a Single Market for radio equipment by setting essential requirements for safety and health, electromagnetic compatibility, and the efficient use of the radio spectrum.

The RED aligned the previous Directive, the Radio and Telecommunication Terminal Equipment Directive 1999/5/EC (R&TTED), with the new legislative framework for the marketing of products. The RED is applicable as of 2016-06-13. It included a one-year transitional period, which ended on 2017-06-12 (Article 48). On 2017-06-20, the Commission Implementing

Regulation (EU) 2017/1354 was adopted. This specifies how to present the information provided for in Article 10(10) of Directive 2014/53/EU.

Article 10(10) RED

In cases of restrictions on putting into service or of requirements for authorisation of use, information available on the packaging shall allow the identification of the Member States or the geographical area within a Member State where restrictions on putting into service or requirements for authorisation of use exist. Such information shall be completed in the instructions accompanying the radio equipment. The Commission may adopt implementing acts specifying how to present that information. Those implementing acts shall be adopted in accordance with the advisory procedure referred to in Article 45(2).

- **Class 1:**
Radio equipment that can be operated without any restriction in EU, EEA, and EFTA. According to Article 8(1)b of the RED, it is clarified that no national radio interfaces specifications are required to be notified under RED;
- **Class 2:**
Radio equipment subject to restrictions in one or more EU, EEA and EFTA countries where:
 - The technical parameters are not harmonised through EU, EEA, and EFTA;
 - The technical parameters are harmonised through EU, EEA and EFTA, and do not fall in above class 1 definition.

Radio equipment class means a class identifying particular categories of radio equipment which, under this Directive, are considered similar and those radio interfaces for which the radio equipment is designed.

Article 8 RED

Notification of radio interface specifications and assignment of radio equipment classes 1:

- 1) Member States shall notify, in accordance with the procedure set out in Directive 98/34/EC, the radio interfaces which they intend to regulate except:
 - a) The radio interfaces which fully and without any deviation comply with the Commission decisions on the harmonised use of radio spectrum adopted pursuant to Decision No. 676/2002/EC; and
 - b) The radio interfaces which, in accordance with implementing acts adopted pursuant to paragraph 2 of this Article, correspond to radio equipment which can be put into service and used without restrictions within the Union.
- 2) The Commission shall adopt implementing acts establishing the equivalence between notified radio interfaces and assigning a radio equipment class, details of which shall be published in the Official Journal of the European Union. Those implementing acts shall be adopted in accordance with the examination procedure referred to in Article 45(3).

The Radio Interface Specifications Templates are provided for information in the EFIS database for applications which use is in harmonised radio spectrum, however with restrictions.

6.3.2 Equipment Classes

The PAN9026 is a radio module classified as class-1 or class-2 radio equipment depending on the frequency band in which it can operate. This equipment class is passed on the end-product which integrates the module.

Class 1

Class 1 radio equipment can be placed on the market and put into service without restrictions according to Article 1(3) of Commission Decision 2000/299/EC (Version 2018-01).

This radio module is defined as Class 1 radio equipment when it is restricted to operate in the following frequency bands:

Sub-class of Class 1	Application/Reference	Frequency Band (MHz)	Transmit Power/Power Density
22	Wideband Data Transmission Systems EN 300 328	2 400 to 2 483.5	100 mW e.i.r.p and 100 mW/100 kHz e.i.r.p. density applies when frequency hopping modulation is used, 10 mW/MHz e.i.r.p. density applies when other types of modulation are used.
54	Wireless Access Systems including Radio Local Area Networks (WAS/RLANs) EN 301 893	5 470 to 5 725	1 W mean e.i.r.p., 50 mW/MHz mean e.i.r.p. density in any 1 MHz band.
43	Non-Specific Short Range Devices EN 300 440	5 725 to 5 875	25 mW e.i.r.p.

Class 2

Class 2 radio equipment are restricted in accordance with Article 1(3) of Commission Decision 2000/299/EC1 if the equipment falls within the scope of Class 2.

This radio module is also defined as Class 2 radio equipment when it is restricted to operate in the following frequency bands:

Sub-class of Class 2	Application/Reference	Frequency Band (MHz)	Transmit Power/Power Density
H01	Wireless Access Systems including Radio Local Area Networks (WAS/RLANs) Restricted to indoor use EN 301 893	5 150 to 5 350	Max. 200 mW mean e.i.r.p. and max. 10 mW/MHz mean e.i.r.p. density in any 1 MHz band.

The usage of PAN9026 module in a vehicular environment cannot be considered as **indoor use**.

6.4 Bluetooth Qualification

The PAN9026 series modules are Bluetooth qualified as "Controller Subsystem". Following the qualified design ID's listed for the module:

Bluetooth Product	Project Name	Power Class		Model	Declaration ID	QDID
		BR/EDR	LE			
Controller Subsystem	PAN9026 Class I	1	1.5	ENWF920xA1EF	D044188	128779
	PAN9026 Class II	2	2		D044187	129672

If the module is combined with a host stack that is Bluetooth qualified as "Host Subsystem" it is possible to list an "End Product" without any further qualification tests.

The OpenSynergy Bluetooth software is commercially available and is delivered in source code format. Applications that are built using the Blue SDK are executed in Linux user space making development easy. The stack software and profiles are qualified components and are listed on the Bluetooth SIG website.
