

## FEATURES

**Single-supply operation: 1.8 V to 5 V**  
**Offset voltage: 6 mV maximum**  
**Space-saving SOT-23 and SC70 packages**  
**Slew rate: 2.7 V/ $\mu$ s**  
**Bandwidth: 5 MHz**  
**Rail-to-rail input and output swing**  
**Low input bias current: 2 pA typical**  
**Low supply current @ 1.8 V: 450  $\mu$ A maximum**

## APPLICATIONS

**Portable communications**  
**Portable phones**  
**Sensor interfaces**  
**Laser scanners**  
**PCMCIA cards**  
**Battery-powered devices**  
**New generation phones**  
**Personal digital assistants**

## GENERAL DESCRIPTION

The **AD8515** is a rail-to-rail amplifier that can operate from a single-supply voltage as low as 1.8 V.

The **AD8515** single amplifier, available in 5-lead SOT-23 and 5-lead SC70 packages, is small enough to be placed next to sensors, reducing external noise pickup.

## PIN CONFIGURATION

Figure 1. 5-Lead SC70 and 5-Lead SOT-23  
(KS and RJ Suffixes)

The **AD8515** is a rail-to-rail input and output amplifier with a gain bandwidth of 5 MHz and typical offset voltage of 1 mV from a 1.8 V supply. The low supply current makes these parts ideal for battery-powered applications. The 2.7 V/ $\mu$ s slew rate makes the **AD8515** a good match for driving ASIC inputs such as voice codecs.

The **AD8515** is specified over the extended industrial temperature range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ .

## ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$ , unless otherwise noted.

Table 4.

Parameter	Rating
Supply Voltage	6 V
Input Voltage	GND to $V_S$
Differential Input Voltage	$\pm 6\text{ V}$ or $\pm V_S$
Output Short-Circuit Duration to GND	Observe derating curves
Storage Temperature Range KS and RJ Packages	$-65^\circ\text{C}$ to $+150^\circ\text{C}$
Operating Temperature Range AD8515	$-40^\circ\text{C}$ to $+125^\circ\text{C}$
Junction Temperature Range KS and RJ Packages	$-65^\circ\text{C}$ to $+150^\circ\text{C}$
Lead Temperature (Soldering, 60 sec)	$300^\circ\text{C}$

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

## THERMAL RESISTANCE

$\theta_{JA}$  is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 5. Thermal Resistance

Package Type	$\theta_{JA}$	$\theta_{JC}$	Unit
5-Lead SOT-23 (RJ)	230	146	$^\circ\text{C}/\text{W}$
5-Lead SC70 (KS)	376	126	$^\circ\text{C}/\text{W}$

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## THEORY OF OPERATION

The [AD8515](#), offered in space-saving SOT-23 and SC70 packages, is a rail-to-rail input and output operational amplifier that can operate at supply voltages as low as 1.8 V. This product is fabricated using 0.6 micron CMOS to achieve one of the best power consumption-to-speed ratios (that is, bandwidth) in the industry. With a small amount of supply current (less than 400  $\mu$ A), a wide unity gain bandwidth of 4.5 MHz is available for signal processing.

The input stage consists of two parallel, complementary, differential pairs of PMOS and NMOS. The [AD8515](#) exhibits no phase reversal because the input signal exceeds the supply by more than 0.6 V. Currents into the input pin must be limited to 5 mA or less by the use of external series resistance(s). The [AD8515](#) has a very robust ESD design and can stand ESD voltages of up to 4000 V.

### POWER CONSUMPTION vs. BANDWIDTH

One of the strongest features of the [AD8515](#) is the bandwidth stability over the specified temperature range while consuming small amounts of current. This effect is shown in Figure 2 through Figure 4.

This product solves the speed/power requirements for many applications. The wide bandwidth is also stable even when operated with low supply voltages. Figure 5 shows the relationship between the supply voltage vs. the bandwidth for the [AD8515](#).

The [AD8515](#) is ideal for battery-powered instrumentation and handheld devices because it can operate at the end of discharge voltage of most popular batteries. Table 6 lists the nominal and end of discharge voltages of several typical batteries.

**Table 6. Typical Battery Life Voltage Range**

Battery	Nominal Voltage (V)	End of Discharge Voltage (V)
Lead-Acid	2	1.8
Lithium	2.6 to 3.6	1.7 to 2.4
NiMH	1.2	1
NiCd	1.2	1
Carbon-Zinc	1.5	1.1

### DRIVING CAPACITIVE LOADS

Most amplifiers have difficulty driving large capacitive loads. Additionally, higher capacitance at the output can increase the amount of overshoot and ringing in the amplifier's step response and can even affect the stability of the device. This is due to the degradation of phase margin caused by additional phase lag from the capacitive load. The value of capacitive load that an amplifier can drive before oscillation varies with gain, supply voltage, input signal, temperature, and other parameters. Unity gain is the most challenging configuration for driving capacitive loads. The AD8515 is capable of driving large capacitive loads without any external compensation. The graphs in Figure 31 and Figure 32 show the amplifier's capacitive load driving capability when configured in unity gain of +1.

The AD8515 is even capable of driving higher capacitive loads in inverting gain of -1, as shown in Figure 33.

Figure 31. Capacitive Load Driving @ C<sub>L</sub> = 50 pF

Figure 32. Capacitive Load Driving @ C<sub>L</sub> = 500 pF

Figure 33. Capacitive Load Driving @ C<sub>L</sub> = 800 pF

### FULL POWER BANDWIDTH

The slew rate of an amplifier determines the maximum frequency at which it can respond to a large input signal. This frequency (known as full power bandwidth, FPBW) can be calculated from the equation

$$FPBW = \frac{SR}{2\pi \times V_{PEAK}}$$

for a given distortion. The FPBW of the AD8515 is shown in Figure 34 to be close to 200 kHz.

Figure 34. Full Power Bandwidth

## A MICROPPOWER REFERENCE VOLTAGE GENERATOR

Many single-supply circuits are configured with the circuit biased to one-half of the supply voltage. In these cases, a false ground reference can be created by using a voltage divider buffered by an amplifier. Figure 35 shows the schematic for such a circuit. The two 1 MΩ resistors generate the reference voltages while drawing only 0.9 μA of current from a 1.8 V supply. A capacitor connected from the inverting terminal to the output of the op amp provides compensation to allow for a bypass capacitor to be connected at the reference output. This bypass capacitor helps establish an ac ground for the reference output.

Figure 35. Micropower Voltage Reference Generator

## A 100 kHz SINGLE-SUPPLY SECOND-ORDER BAND-PASS FILTER

The circuit in Figure 36 is commonly used in portable applications where low power consumption and wide bandwidth are required. This figure shows a circuit for a single-supply band-pass filter with a center frequency of 100 kHz. It is essential that the op amp have a loop gain at 100 kHz to maintain an accurate center frequency. This loop gain requirement necessitates the choice of an op amp with a high unity gain crossover frequency, such as the AD8515. The 4.5 MHz bandwidth of the AD8515 is sufficient to accurately produce the 100 kHz center frequency, as the response in Figure 37 shows. When the op amp bandwidth is close to the center frequency of the filter, the amplifier internal phase shift causes excess phase shift at 100 kHz, altering the filter response. In fact, if the chosen op amp has a bandwidth close to 100 kHz, the phase shift of the op amps causes the loop to oscillate.

A common-mode bias level is easily created by connecting the noninverting input to a resistor divider consisting of two resistors connected between VCC and ground. This bias point is also decoupled to ground with a 1 μF capacitor.

$$f_L = \frac{1}{2\pi \times R1 \times C1}$$

$$f_H = \frac{1}{2\pi \times R1 \times C1}$$

$$H_0 = 1 + \frac{R1}{R2}$$

$$VCC = 1.8 \text{ V} - 5 \text{ V}$$

where:

$f_L$  is the low -3 dB frequency.

$f_H$  is the high -3 dB frequency.

$H_0$  is the midfrequency gain.

Figure 36. Second-Order Band-Pass Filter

Figure 37. Frequency Response of the Band-Pass Filter

## WIEN BRIDGE OSCILLATOR

The circuit in Figure 38 can be used to generate a sine wave, one of the most fundamental waveforms. Known as a Wien Bridge oscillator, it has the advantage of requiring only one low power amplifier. This is an important consideration, especially for battery-operated applications where power consumption is a critical issue. To keep the equations simple, the resistor and capacitor values used are kept equal. For the oscillation to happen, two conditions have to be met. First, there should be a zero phase shift from the input to the output, which happens at the oscillation frequency of

$$f_{osc} = \frac{1}{2\pi R10 \times C10}$$

Second, at this frequency, the ratio of VOUT to the voltage at the positive input (+IN, Pin 3) has to be 3, which means that the ratio of R11:R12 should be greater than 2.

Figure 38. Low Power Wien Bridge Oscillator

High frequency oscillators can be built with the AD8515, due to its wide bandwidth. Using the values shown, an oscillation frequency of 130 kHz is created and is shown in Figure 39. If R11 is too low, the oscillation might converge; if too large, the oscillation diverges until the output clips ( $V_s = \pm 2.5$  V,  $f_{osc} = 130$  kHz).

Figure 39. Output of Wien Bridge Oscillator
