## HMC574AMS8E

v01.0316

# GaAs MMIC 5 WATT T/R SWITCH DC - 3 GHz 

## Typical Applications

The HMC574AMS8E is ideal for:

- Cellular/3G Infrastructure
- Private Mobile Radio Handsets
- WLAN, WiMAX \& WiBro
- Automotive Telematics
- Test Equipment

Functional Diagram

## Features

Low Insertion Loss: 0.3 dB
High Third Order Intercept: +63 dBm
Isolation: 30 dB
Single Positive Supply: +3 to +8V
SMT Package: MSOP8

## General Description

The HMC574AMS8E is low-cost SPDT switch in 8-lead MSOP packages for use in transmit/ receive applications which requires very low distortion at high incident power levels. The device can control signals from DC to 3 GHz and is especially suited for Cellular/3G infrastructure, WiMAX and WiBro applications with only 0.3 dB typical insertion loss. The design provides 5 watt power handling performance and +63 dBm third order intercept at +8 Volt bias. RF1 and RF2 are reflective shorts when "Off".

## Typical Application Circuit

## Notes:

1. Set logic gate and switch $\mathrm{Vdd}=+3 \mathrm{~V}$ to +5 V and use HCT series logic to provide a TTL driver interface.
2. Control inputs $A / B$ can be driven directly with $C M O S$ logic $(H C)$ with Vdd of +3 to +8 Volts applied to the CMOS logic gates and to pin 4 of the RF switch.
3. DC Blocking capacitors are required for each RF port as shown. Capacitor value determines lowest frequency of operation.
4. Highest RF signal power capability is achieved with Vdd set to +8 V . The switch will operate properly (but at lower RF power capability) at bias voltages down to +3 V .

[2] Circuit Board Material: Rogers 4350
The circuit board used in the application should be generated with proper RF circuit design techniques. Signal lines at the RF port should have 50 Ohm impedance and the package ground leads and package bottom should be connected directly to the ground plane similar to that shown above. The evaluation circuit board shown above is available from Analog Devices Inc upon request.
