### Typical Applications

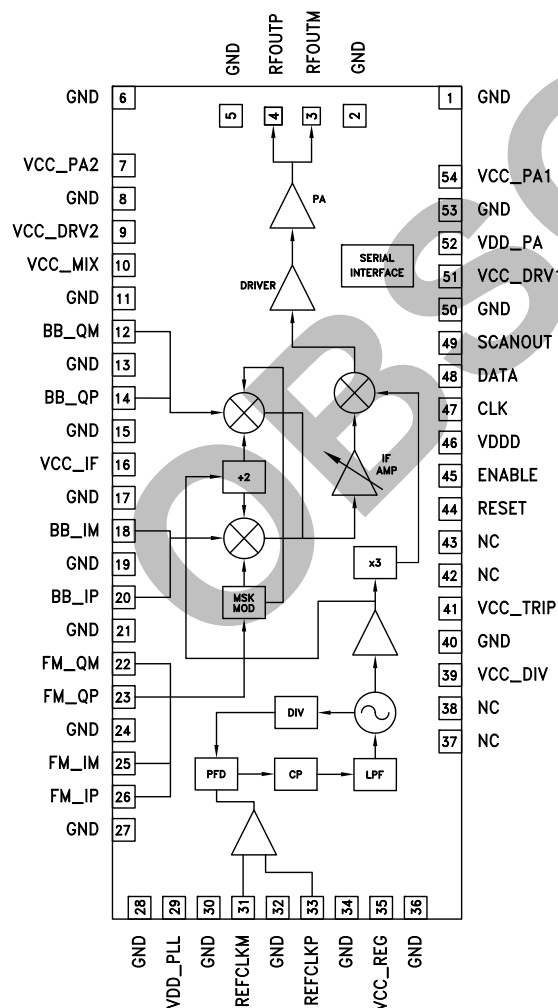

The HMC6000 is ideal for:

- WiGig Single Carrier Modulations
- 60 GHz ISM Band Data Transmitter
- Multi-Gbps Data Communications
- High Definition Video Transmission
- RFID

### Features

- Support for IEEE Channel Plan
- Output Power: 12 dBm
- Max Gain: 38 dB
- Gain Control Range: 17 dB
- Integrated Frequency Synthesizer
- Integrated Image Reject Filter
- Programmable IF Gain Block
- Universal Analog I/Q Baseband Interface
- Three-Wire Serial Digital Interface
- Die Size: 4.082 x 1.814 mm

### Functional Diagram

### General Description

The HMC6000 is a complete mmWave transmitter on a chip operating from 57 to 64 GHz with 1.8 GHz of modulation bandwidth. An integrated synthesizer provides tuning in 500 or 540 MHz step sizes depending on the choice of external reference clock. Support for a wide variety of modulation formats is provided through a universal analog baseband IQ interface. The transmitter chip supports all single carrier WiGig modulations and optionally supports dedicated FSK/MSK modulation formats for lower cost and lower power serial data links without the need for high speed data converters. A differential output provides up to 12 dBm linear output power into a 100 ohm load. Together with the HMC6001, a complete transmit/receive chipset is provided for multi-Gbps operation in the unlicensed 60 GHz ISM band.

Pad Number	Function	Description
1, 2, 5, 6, 8, 11, 13, 15, 17, 19, 21, 24, 27, 28, 30, 32, 34, 36, 40, 50, 53	GND	Analog Ground
3	RFOUTM	RF negative output – DC coupled – diff match to 100Ω [1]
4	RFOUTP	RF positive output – DC coupled – diff match to 100Ω [1]
7	VCC_PA2	4.0V supply (PA)
9	VCC_DRV2	2.7V supply (Driver)
10	VCC_MIX	2.7V (Mixer)
12	BB_QM	Baseband negative quadrature input – DC coupled - 50Ω
14	BB_QP	Baseband positive quadrature input – DC coupled - 50Ω
16	VCC_IF	2.7V supply (IF)
18	BB_IM	Baseband negative in-phase input – DC coupled - 50Ω
20	BB_IP	Baseband positive in-phase input – DC coupled - 50Ω
22	FM_QM	FSK negative quadrature input – DC coupled - 50Ω
23	FM_QP	FSK positive quadrature input – DC coupled - 50Ω
25	FM_IM	FSK negative in-phase input – DC coupled - 50Ω
26	FM_IP	FSK positive in-phase input – DC coupled - 50Ω
29	VDD_PLL	1.35V supply (VCO)
31	REFCLKM	Xtal REF CLK Minus - AC or DC coupled - 50Ω
33	REFCLKP	Xtal REF CLK Plus - AC or DC coupled - 50Ω
35	VCC_REG	2.7V supply (VCO)
37, 38, 42, 43	NC	Factory test points. Leave floating. Do not connect.
39	VCC_DIV	2.7V supply (Divider)
41	VCC_TRIP	2.7V supply (Tripler)
44	RESET	Asynchronous reset-all registers (1.2V CMOS, active high)
45	ENABLE	Serial digital interface enable (1.2V CMOS) - 50kΩ
46	VDDD	1.35V supply (serial digital interface)
47	CLK	Serial digital interface clock (1.2V CMOS) - 50kΩ
48	DATA	Serial digital interface data (1.2V CMOS) - 50kΩ
49	SCANOUT	Serial digital interface out (1.2V CMOS) - 50kΩ
51	VCC_DRV1	2.7V supply (Driver)
52	VDD_PA	2.7V supply (PA)
54	VDD_PA1	4.0V supply (PA)

[1] 4.0Vdc present at the TX RF output pads. To avoid damaging the Power Amplifier the pads must be AC coupled to any other DC voltage including ground

### Theory of Operation

An integrated frequency synthesizer creates a low-phase noise LO between 16.3 and 18.3 GHz. This is divided by 2, split into quadrature components and used to modulate differential baseband I and Q signals onto an 8 to 9.1 GHz sliding IF. This signal is then filtered and amplified with 17 dB of variable gain, then mixed with three times the LO frequency to upconvert to an RF frequency between 57 and 64 GHz. The step size of the synthesizer equates to 540MHz steps at RF when used with 308.5714 MHz reference crystal (compatible with the IEEE channels of the ISM band) or 500 MHz steps if used with a 285.714 MHz reference crystal. Integrated notch filters attenuate the lower mixing product at 40-46GHz. Two RF amplifier stages provide gain to allow up to 12 dBm differential output.

The phase noise and quadrature balance of the HMC6000 is sufficient to carry up to 16QAM modulation.

There are no special power sequencing requirements for the HMC6000; all voltages are to be applied simultaneously.

### Register Array Assignments and Serial Interface

The register arrays for both the transmitter and receiver are organized into 16 rows of 8 bits. Using the serial interface, the arrays are written or read one row at a time as shown in Figure 22 and Figure 23, respectively. Figure 22 shows the sequence of signals on the ENABLE, CLK, and DATA lines to write one 8-bit row of the register array. The ENABLE line goes low, the first of 18 data bits (bit 0) is placed on the DATA line, and 2 ns or more after the DATA line stabilizes, the CLK line goes high to clock in data bit 0. The DATA line should remain stable for at least 2 ns after the rising edge of CLK.

The Tx IC will support a serial interface running up to several hundred MHz, and the interface is 1.2V CMOS levels. A write operation requires 18 data bits and 18 clock pulses, as shown in Figure 22. The 18 data bits contain the 8-bit register array row data (LSB is clocked in first), followed by the register array row address (ROW0 through ROW15, 000000 to 001111, LSB first), the Read/Write bit (set to 1 to write), and finally the Tx chip address 110, LSB first).

*Note that the register array row address is 6 bits, but only four are used to designate 16 rows, the two MSBs are 0.*

After the 18th clock pulse of the write operation, the ENABLE line returns high to load the register array on the IC; prior to the rising edge of the ENABLE line, no data is written to the array. The CLK line should have stabilized in the low state at least 2 ns prior to the rising edge of the ENABLE line.

ROW13<4>	INI	This bit is reserved for diagnostic purposes; ROW13<4> = 0 for normal operation
ROW13<3>	PDDIV12	Active high to power down 1.2V circuits in synthesizer divider
ROW13<2>	PDDIV27	Active high to power down 2.7V circuits in synthesizer divider
ROW13<1>	PDQP	Active high to power down synthesizer charge pump
ROW13<0>	PDVCO	Active high to power down synthesizer VCO
<b>ROW14</b>		
ROW14<7>	PDCAL	Active high to power down VCO calibration comparators; ROW14<7> = 0 for normal operation
ROW14<6>	MUXOUT	Controls multiplexing of diagnostic bits, high to read Row 15<7:0> ROW14<6> = 1 for normal operation
ROW14<5>	PDALC12	Active high to power down VCO automatic level control (ALC); ROW14<5> = 1 for normal operation
ROW14<4>	PLOAD	Active high to load external amplitude adjustment bits for VCO ROW14<4> = 1 for normal operation

**Table 9. Transmitter Register Array Assignments**

Register Array Row & Bit	Internal Signal Name	Signal Function
ROW14<3>	WIDE<1>	Control bits for VCO ALC loop; ROW14<3:2> = 01 for normal operation
ROW14<2>	WIDE<0>	
ROW14<1>	SLEW<1>	Controls slew rate in sub-integer N divider ROW14<1:0> = 10 for normal operation
ROW14<0>	SLEW<0>	
<b>ROW15</b>		
ROW15<7>	COMPP	Read only bits to indicate synthesizer lock: ROW15<7:6> = 01 indicates that the VCO control voltage is within the lock window and the synthesizer is locked. 11 indicates the VCO control voltage above lock window 00 below lock window 10 is a disallowed state indicating an error
ROW15<6>	COMPN	
ROW15<5>	RDACMSB<2>	These bits are read only and reserved for factory diagnostic purposes.
ROW15<4>	RDACMSB<1>	
ROW15<3>	RDACMSB<0>	
ROW15<2>	RDACMUX<0>	These bits are read only and reserved for factory diagnostic purposes.
ROW15<1>	RDACMUX<1>	
ROW15<0>	RDACMUX<2>	

### Synthesizer Settings

**Table 10. IEEE Channels Using 308.5714 MHz Reference**

Frequency (GHz)	Divider Setting	Typical Band Setting
57.24	10101	001
57.78	10100	001
58.32 (IEEE CH 1)	10011	010
58.86	10010	010
59.40	10001	011
59.94	10000	011
60.48 (IEEE CH 2)	11111	100
61.02	00000	100
61.56	00001	101
62.10	00010	101
62.64 (IEEE CH 3)	00011	110
63.18	00100	110
63.72	00101	111

Divide Ratio settings consist of registers ROW10 bit <0> (MSB) and ROW11 bits <4:7> (4 LSBs)

**Table 11. 500 MHz Channels Using 285.7143 MHz Reference**

Frequency (GHz)	Divider Setting	Typical Band Setting
57	00001	000
57.5	00010	000
58	00011	001
58.5	00100	001
59	00101	010
59.5	00110	010
60	00111	011
60.5	01000	011
61	01001	100
61.5	01010	100
62	01011	101
62.5	01100	101
63	01101	110
63.5	01110	110
64	01111	111

Divide Ratio settings consist of registers ROW10 bit <0> (MSB) and ROW11 bits <4:7> (4 LSBs)

**Table 12. Typical IF VGA and IF Upmixer Filter Settings**

Frequency (GHz)	IF VGA Filter Setting (ifvga_tune)	IF UPMIXER Filter Setting (if_upmixer_tune)
57-60	1000	1010
60-62	1011	1111
62-64	1111	1111

if\_vga\_tune settings consist of registers ROW6 bit <3:0> (4 MSBs)

if\_upmixer\_tune settings consist of registers ROW7 <3:0> (4 MSBs)

**MILLIMETERWAVE TRANSMITTER IC**  
**57 - 64 GHz**

**Table 13. Pad Discriptions**

Item	Function	Pad Description	Interface Schematic
12,14,18,20	BB_QM BB_QP BB_IM BB_IP	Pads are DC coupled, matched to 50Ω (100Ω differential)	
22,23,25,26	FM_QM FM_QP Fm_IM FM_IP	Pads are DC coupled, matched to 50Ω (100Ω differential)	
31,33	REFCLKM REFCLKP	Pads are DC coupled, matched to 50Ω (100Ω differential)	
3,4	RFOUTM RFOUTP	Pads are DC coupled, matched to 50Ω (100Ω differential)	

**Table 14. Evaluation Kit Order Information**

Item	Part Number	Description
1	EKIT01-HMC6450	60 GHz Antenna in Package Transceiver Evaluation Kit

OBSOLETE

**MILLIMETERWAVE TRANSMITTER IC**  
**57 - 64 GHz****Mounting & Bonding Techniques for Millimeterwave SiGe Die**

The die should be attached directly to the ground plane with conductive epoxy (see HMC general Handling, Mounting, Bonding Note).

**Handling Precautions**

Follow these precautions to avoid permanent damage.

**Storage:** All bare die are placed in either Waffle or Gel based ESD protective containers, and then sealed in an ESD protective bag for shipment. Once the sealed ESD protective bag has been opened, all die should be stored in a dry nitrogen environment.

**Cleanliness:** Handle the chips in a clean environment. DO NOT attempt to clean the chip using liquid cleaning systems.

**Static Sensitivity:** Follow ESD precautions to protect against ESD strikes.

**Transients:** Suppress instrument and bias supply transients while bias is applied. Use shielded signal and bias cables to minimize inductive pick-up.

**General Handling:** Handle the chip along the edges with a sharp pair of bent tweezers or use a top side vacuum tool to pick and place. The surface should not be touched with tweezers or fingers.

**Mounting**

The chip should be mounted with electrically conductive epoxy. The mounting surface should be clean and flat.

**Epoxy Die Attach:** Apply a minimum amount of epoxy to the mounting surface so that a fillet is observed around the perimeter of the chip once it is placed into position. Cure epoxy per the manufacturer's recommendation.

**Wire Bonding**

RF bonds made with 0.003" (0.076mm) x 0.0005" (0.012mm) ribbon are recommended and should be thermosonically bonded. DC bonds of 0.001" (0.025 mm) diameter are recommended and should also be thermosonically bonded. All bonds should be made with a nominal stage temperature of 150 °C. A minimum amount of ultrasonic energy should be applied to achieve reliable bonds. All bonds should be as short as possible.
