GENERAL DESCRIPTION

The [HMC434-EP](#) is a low noise, static, divide by 8 prescaler monolithic microwave integrated circuit (MMIC) utilizing indium gallium phosphide/gallium arsenide (InGaP/GaAs) heterojunction bipolar transistor (HBT) technology in an ultrasmall surface-mount 6-lead SOT-23 package.

The [HMC434-EP](#) operates from near dc (square wave) or 0.2 GHz (sine wave) to 8 GHz input frequency with a single 3 V dc supply.

FUNCTIONAL BLOCK DIAGRAM

The [HMC434-EP](#) features single-ended inputs and outputs for reduced component count and cost. The low additive single sideband (SSB) phase noise of -150 dBc/Hz at 100 kHz offset helps the user maintain optimal system noise performance.

Additional application and technical information can be found in the [HMC434](#) data sheet.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operating environment. Careful attention to PCB thermal design is required.

θ_{JA} is the natural convection junction to ambient thermal resistance measured in a one cubic foot sealed enclosure. θ_{JC} is the junction to case thermal resistance.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.
