

# Fast Settling, JFET Input Operational Amplifier

## FEATURES

- 100% Tested Settling Time to 1mV at Sum Node, 10V Step Tested with Fixed Feedback Capacitor
 

340ns Typ
540ns Max
- Slew Rate
 

60V/μs Min
14MHz
- Gain Bandwidth Product
 

1.2 MHz
60°
- Power Bandwidth (20Vp-p)
- Unity Gain Stable; Phase Margin
- Input Offset Voltage
 

600μV Max
-----------
- Input Bias Current
 

25°C 75pA Max
70°C 600pA Max
- Input Offset Current
 

25°C 40pA Max
70°C 150pA Max
- Low Distortion

## APPLICATIONS

- Fast 12-Bit D/A Output Amplifiers
- High Speed Buffers
- Fast Sample and Hold Amplifiers
- High Speed Integrators
- Voltage to Frequency Converters
- Active Filters
- Log Amplifiers
- Peak Detectors

## DESCRIPTION

The LT1122 JFET input operational amplifier combines high speed and precision performance.

A unique poly-gate JFET process minimizes gate series resistance and gate-to-drain capacitance, facilitating wide bandwidth performance, without degrading JFET transistor matching.

It slews at 80V/μs and settles in 340ns. The LT1122 is internally compensated to be unity gain stable, yet it has a bandwidth of 14MHz at a supply current of only 7mA. Its speed makes the LT1122 an ideal choice for fast settling 12-bit data conversion and acquisition systems.

The LT1122 offset voltage of 120μV, and voltage gain of 500,000 also support the 12-bit accurate applications.

The input bias current of 10pA and offset current of 4pA combined with its speed allow the LT1122 to be used in such applications as high speed sample and hold amplifiers, peak detectors, and integrators.

## TYPICAL APPLICATION

12-Bit Voltage Output D/A Converter

12-BIT CURRENT OUTPUT D/A CONVERTER  
 $C_f = 5\text{pF TO } 17\text{pF}$   
 (DEPENDENT ON D/A CONVERTER USED)

LT1122-TA01

Large-Signal Response

200ns/DIV  
 $AV = -1$

1122 TA07

# LT1122

## ABSOLUTE MAXIMUM RATINGS

Supply Voltage .....	± 20V
Differential Input Voltage .....	± 40V
Input Voltage .....	± 20V
Output Short Circuit Duration .....	Indefinite
Lead Temperature (Soldering, 10 sec.).....	300°C

Operating Temperature Range	
LT1122AM/BM/CM/DM .....	– 55°C to 125°C
LT1122AC/BC/CC/DC/CS/DS .....	– 40°C to 85°C
Storage Temperature Range	
All Devices .....	– 65°C to 150°C

The ● denotes the specifications which apply over the full operating temperature range.

**Note 1:** The LT1122 is measured in an automated tester in less than one second after application of power. Depending on the package used, power dissipation, heat sinking, and air flow conditions, the fully warmed up chip temperature can be  $10^\circ C$  to  $50^\circ C$  higher than the ambient temperature.

**Note 2:** Settling time is 100% tested for A and C grades using the settling time test circuit shown. This test is not included in quality assurance sample testing.

**Note 3:** Input voltage range functionality is assured by testing offset voltage at the input voltage range limits to a maximum of 4mV (A, B grades), to 5.7mV (C, D grades).

**Note 4:** Minimum supply voltage is tested by measuring offset voltage to 7mV maximum at  $\pm 5V$  supplies.

**Note 5:** The LT1122 is not tested and not quality-assurance-sampled at  $-40^\circ C$  and at  $85^\circ C$ . These specifications are guaranteed by design, correlation and/or inference from  $-55^\circ C$ ,  $0^\circ C$ ,  $25^\circ C$ ,  $70^\circ C$  and/or  $125^\circ C$  tests.

## APPLICATIONS INFORMATION

### Settling Time Measurements

Settling time test circuits shown on some competitive devices' data sheets require:

1. A "flat top" pulse generator. Unfortunately, flat top pulse generators are not commercially available.
2. A variable feedback capacitor around the device under test. This capacitor varies over a four to one range. Presumably, as each op amp is measured for settling time, the capacitor is fine tuned to optimize settling time for that particular device.
3. A small inductor load to optimize settling.

The LT1122's settling time is 100% tested in the test circuit shown. No "flat top" pulse generator is required. The test circuit can be readily constructed, using commercially available ICs. Of course, standard high frequency board construction techniques should be followed. All LT1122s are measured with a constant feedback capacitor. No fine tuning is required.

### Speed Boost/Overcompensation Terminal

Pin 8 of the LT1122 can be used to change the input stage operating current of the device. Shorting pin 8 to the positive supply (Pin 7) increases slew rate and bandwidth by about 25%, but at the expense of a reduction in phase margin by approximately 18 degrees. Unity gain capacitive load handling decreases from typically 500pF to 100pF.

Conversely, connecting a 15k resistor from pin 8 to ground pulls 1mA out of pin 8 (with  $V^+ = 15V$ ). This reduces slew rate and bandwidth by 25%. Phase margin and capacitive load handling improve; the latter typically increasing to 800pF.

### High Speed Operation

As with most high speed amplifiers, care should be taken with supply decoupling, lead dress and component placement.

The power supply connections to the LT1122 must maintain a low impedance to ground over a bandwidth of 20MHz. This is especially important when driving a significant resistive or capacitive load, since all current delivered to the load comes from the power supplies. Multiple high quality bypass capacitors are recommended for each power supply line in any critical application. A 0.1µF ceramic and a 1µF electrolytic capacitor, as shown, placed as close as possible to the amplifier (with short lead lengths to power supply common) will assure adequate high frequency bypassing, in most applications.

LT1122-TA03

When the feedback around the op amp is resistive ( $R_F$ ), a pole will be created with  $R_F$ , the source resistance ( $R_S$ ,  $C_S$ ), and the amplifier input capacitance ( $C_{IN} \approx 4pF$ ). In low closed loop gain configurations and with  $R_S$  and  $R_F$  in the kilohm range, this pole can create excess phase shift and even oscillation. A small capacitor ( $C_F$ ) in parallel with  $R_F$  eliminates this problem. With  $R_S (C_S + C_{IN}) = R_F C_F$ , the effect of the feedback pole is completely removed.

LT1122-TA04

# TYPICAL APPLICATIONS

Quartz Stabilized Oscillator With 9ppm Distortion

Wide-Band, Filtered, Full Wave Rectifier
