

FEATURES

- Complete single-chip JPEG2000 compression and decompression solution for video and still images**
- Patented SURF® (spatial ultra-efficient recursive filtering) technology enables low power and low cost wavelet-based compression**
- Supports both 9/7 and 5/3 wavelet transforms with up to 6 levels of transform**
- Programmable tile/image size with widths up to 2048 pixels in 3-component 4:2:2 interleaved mode, and up to 4096 pixels in single-component mode**
- Maximum tile/image width: 4096 pixels**
- Video interface directly supporting ITU.R-BT656, SMPTE125M PAL/ NTSC, SMPTE274M, SMPTE293M (525p), ITU.R-BT1358 (625p) or any video format with a maximum input rate of 65 MSPS for irreversible mode or 40 MSPS for reversible mode**
- Two or more ADV202s can be combined to support full-frame SMPTE274M HDTV (1080i) or SMPTE296M (720p)**
- Flexible asynchronous SRAM-style host interface allows glueless connection to most 16-/32-bit microcontrollers and ASICs**
- 2.5 V to 3.3 V I/O and 1.5 V core supply**
- 12 mm × 12 mm 121-lead CSPBGA, speed grade 115 MHz, or 13 mm × 13 mm 144-lead CSPBGA, speed grade 135 MHz, or 13 mm × 13 mm 144-lead CSPBGA, speed grade 150 MHz**

APPLICATIONS

- Networked video and image distribution systems**
- Wireless video and image distribution**
- Image archival/retrieval**
- Digital CCTV and surveillance systems**
- Digital cinema systems**
- Professional video editing and recording**
- Digital still cameras**
- Digital camcorders**

GENERAL DESCRIPTION

The ADV202 is a single-chip JPEG2000 codec targeted for video and high bandwidth image compression applications that can benefit from the enhanced quality and feature set provided by the JPEG2000 (J2K)—ISO/IEC15444-1 image compression standard. The part implements the computationally intensive operations of the JPEG2000 image compression standard as well as providing fully compliant code-stream generation for most applications.

The ADV202's dedicated video port provides glueless connection to common digital video standards such as ITU.R-BT656, SMPTE125M, SMPTE293M (525p), ITU.R-BT1358 (625p), SMPTE274M (1080i), or SMPTE296M (720p). A variety of other high speed, synchronous pixel and video formats can also be supported using the programmable framing and validation signals.

GENERAL DESCRIPTION

(continued from Page 1)

The ADV202 can process images at a rate of 40 MSPS in reversible mode and at higher rates when used in irreversible mode. The ADV202 contains a dedicated wavelet transform engine, three entropy codecs, an on-board memory system, and an embedded RISC processor that can provide a complete JPEG2000 compression/decompression solution.

The wavelet processor supports the 9/7 irreversible wavelet transform and the 5/3 wavelet transform in reversible and irreversible modes. The entropy codecs support all features in the JPEG2000 Part 1 specification, except Maxshift ROI.

The ADV202 operates on a rectangular array of pixel samples called a tile. A tile can contain a complete image, up to the maximum supported size, or some portion of an image. The maximum horizontal tile size supported depends on the wavelet transform selected and the number of samples in the tile. Images larger than the ADV202's maximum tile size can be broken into individual tiles and then sent sequentially to the chip while still maintaining a single, fully compliant JPEG2000 code stream for the entire image.

JPEG2000 FEATURE SUPPORT

The ADV202 supports a broad set of features that are included in Part 1 of the JPEG2000 standard (ISO/IEC 15444). See [Getting Started with ADV202](#) for information on the JPEG2000 features that the ADV202 currently supports.

Depending on the particular application requirements, the ADV202 can provide varying levels of JPEG2000 compression support. It can provide raw code-block and attribute data output, which allow the host software to have complete control over the generation of the JPEG2000 code stream and other aspects of the compression process such as bit-rate control. Otherwise, the ADV202 can create a complete, fully compliant JPEG2000 code stream (.j2c) and enhanced file formats such as .jp2 and .j2c. See [Getting Started with ADV202](#) for information on the formats that the ADV202 currently supports.

Application notes and other ADV202 support documents can be accessed over the ADV202 product page at:

ABSOLUTE MAXIMUM RATINGS

Table 13.

Parameter	Rating
VDD (Supply Voltage, Core)	−0.3 V to +1.65 V
IOVDD (Supply Voltage, I/O)	−0.3 V to +IOVDD + 0.3 V
PLLVD (Supply Voltage, PLL)	−0.3 V to +1.65 V
Storage Temperature (T _s) Range	−65°C to 150°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL RESISTANCE

θ_{JA} is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 14. Thermal Resistance

Package Type	θ_{JA}	θ_{JC}	Unit
ADV202 (144-Lead)	22.5°	3.8°	C/W
ADV202 (121-Lead)	32.8°	7.92°	C/W

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN BGA ASSIGNMENTS AND FUNCTION DESCRIPTIONS

PIN FUNCTION DESCRIPTIONS

Table 17.

Mnemonic	Pins Used	121-Lead Package	144-Lead Package	I/O	Description
MCLK	1	L9	L12	I	System Input Clock. For details, see the PLL section. Maximum input frequency on MCLK is 74.25 MHz.
$\overline{\text{RESET}}$	1	L7	L11	I	Reset. Causes the ADV202 to immediately reset. $\overline{\text{CS}}$, $\overline{\text{RD}}$, $\overline{\text{WE}}$, $\overline{\text{DACK0}}$, $\overline{\text{DACK1}}$, $\overline{\text{DREQ0}}$, and $\overline{\text{DREQ1}}$ must be held high when a $\overline{\text{RESET}}$ is applied.
HDATA[15:0]	16	D4 to D1, C5 to C3, B5, B4, C2, B3 to B1, A2, A6 to A5	F4, E1 to E3, D1 to D3, C1 to C3, B1 to B3, A2, A3, A4	I/O	Host Data Bus. With HDATA[23:16], [27:24], [31:28], these pins make up the 32-bit wide host data bus. The async host interface is interfaced together with ADDR[3:0], $\overline{\text{CS}}$, $\overline{\text{WE}}$, $\overline{\text{RD}}$, and $\overline{\text{ACK}}$. Unused HDATA pins should be pulled down via a 10 k Ω resistor.
ADDR[3:0]	4	H11, K8, H10, J9	J12, J11, J10, H12	I	Address Bus for the Host Interface.
$\overline{\text{CS}}$	1	J8	H11	I	Chip Select. This signal is used to qualify addressed read and write access to the ADV202 using the host interface.
$\overline{\text{WE}}$	1	J7	H10	I	Write Enable Used with the Host Interface.
$\overline{\text{RDFB}}$					Read Enable When Fly-By DMA Is Enabled. Note: Simultaneous assertion of $\overline{\text{WE}}$ and $\overline{\text{DACK}}$ low activates the HDATA bus, even if the DMA channels are disabled.
$\overline{\text{RD}}$	1	H9	G12	I	Read Enable. Used with the host interface.
$\overline{\text{WEFB}}$					Write Enable When Fly-By DMA Is Enabled. Note: Simultaneous assertion of $\overline{\text{RD}}$ and $\overline{\text{DACK}}$ low activates the HDATA bus, even if the DMA channels are disabled.
$\overline{\text{ACK}}$	1	H8	G11	O	Acknowledge. Used for direct register accesses. This signal indicates that the last register access was successful. Note: Due to synchronization issues, control and status register accesses can incur an additional delay, so the host software should wait for acknowledgment from the ADV202. Accesses to the FIFOs (external DMA modes), on the other hand, are guaranteed to occur immediately, if space is available, and should not wait for $\overline{\text{ACK}}$, if the timing constraints are observed. If $\overline{\text{ACK}}$ is shared with more than one device, $\overline{\text{ACK}}$ should be connected to a pull-up resistor (10 k Ω) and the PLL_HI register, Bit 4, must be set to 1.
$\overline{\text{IRQ}}$	1	G10	G10	O	Interrupt. This pin indicates that the ADV202 requires the attention of the host processor. This pin can be programmed to indicate the status of the internal interrupt conditions within the ADV202. The interrupt sources are enabled via bits in Register EIRQIE.
$\overline{\text{DREQ0}}$	1	F8	F12	O	Data Request for External DMA Interface. Indicates that the ADV202 is ready to send/receive data to/from the FIFO assigned to DMA Channel 0.
$\overline{\text{FSRQ0}}$				O	Used in DCS-DMA Mode. Service request from the FIFO assigned to Channel 0 (asynchronous mode).
$\overline{\text{VALID}}$				O	Valid Indication for JDATA Input/Output Stream. Polarity of this pin is programmable in the EDMOD0 register. $\overline{\text{VALID}}$ is always an output.
CFG[1]				I	Boot Mode Configuration. This pin is read on reset to determine the boot configuration of the on-board processor. The pin should be tied to IOVDD or DGND through a 10 k Ω resistor.
$\overline{\text{DACK0}}$	1	F9	F11	I	Data Acknowledge for External DMA Interface. Signal from the host CPU, which indicates that the data transfer request ($\overline{\text{DREQ0}}$) has been acknowledged and data transfer can proceed. This pin must be held high at all times if the DMA interface is not used, even if the DMA channels are disabled.

Mnemonic	Pins Used	121-Lead Package	144-Lead Package	I/O	Description
HOLD				I	External Hold Indication for JDATA Input/Output Stream. Polarity is programmable in the EDMOD0 register. This pin is always an input.
$\overline{\text{FCS0}}$				I	Used in DCS-DMA Mode. Chip select for the FIFO assigned to Channel 0 (asynchronous mode).
$\overline{\text{DREQ1}}$	1	F10	F10	O	Data Request for External DMA Interface. Indicates that the ADV202 is ready to send/receive data to/from the FIFO assigned to DMA Channel 1.
$\overline{\text{FSRQ1}}$				O	Used in DCS-DMA Mode. Service request from the FIFO assigned to Channel 1 (asynchronous mode).
CFG[2]				I	Boot Mode Configuration. This pin is read on reset to determine the boot configuration of the on-board processor. The pin should be tied to IOVDD or DGND through a 10 k Ω resistor.
$\overline{\text{DACK1}}$	1	G9	F9	I	Data Acknowledge for External DMA Interface. Signal from the host CPU, which indicates that the data transfer request ($\overline{\text{DREQ1}}$) has been acknowledged and data transfer can proceed. This pin must be held high at all times unless a DMA or JDATA access is occurring. This pin must be held high at all times if the DMA interface is not used, even if the DMA channels are disabled.
$\overline{\text{FCS1}}$				I	Used in DCS-DMA Mode. Chip select for the FIFO assigned to Channel 1 (asynchronous mode).
HDATA[31:28]	4	J2 to J4, H1	K3, J1 to J3	I/O	Host Expansion Bus.
JDATA[7:4]				I/O	JDATA Bus (JDATA Mode).
HDATA[27:24]	4	H2 to H4, G4	J4, H1 to H3	I/O	Host Expansion Bus.
JDATA[3:0]				I/O	JDATA Bus (JDATA Mode).
HDATA[23:16]	8	G3, G2, F4, F3, F2 E2, E3, E4	H4, G1 to G4, F1 to F3	I/O	Host Expansion Bus.
SCOMM[7]	8	L2	M2	I/O	When not used, this pin should be tied low via a 10 k Ω resistor.
SCOMM[6]		L3	M3	I/O	When not used, this pin should be tied low via a 10 k Ω resistor.
SCOMM[5]		L4	M4	I/O	This pin must be used in multiple chip mode to align the outputs of two or more ADV202s. For details, see the Applications section and AN-796 ADV202 Multichip Application application note. When not used, this pin should be tied low via a 10 k Ω resistor.
SCOMM[4]		K1	L1	O	LCODE Output in Encode Mode. When LCODE is enabled, the output on this pin indicates on a high transition that the last data-word for a field has been read from the FIFO. For an 8-bit interface, such as JDATA, LCODE is asserted for four consecutive bytes and is enabled by default.
SCOMM[3]		K2	L2	O	This pin should be tied low via a 10 k Ω resistor.
SCOMM[2]		L5	L3	O	This pin should be tied low via a 10 k Ω resistor.
SCOMM[1]		K4	K1	I	This pin should be tied low via a 10 k Ω resistor.
SCOMM[0]		K3	K2	O	This pin should be tied low via a 10 k Ω resistor.
VCLK	1	E9	E12	I	Video Data Clock. Must be supplied if video data is input/output on the VDATA bus.
VDATA[11:0]	12	D11, D10, C7, C9, C10, B7, B8, B9, B11, B10, A7, A10	D10 to D12, C10 to C12, B10 to B12, A9 to A11	I/O	Video Data. Unused pins should be pulled down via a 10 k Ω resistor.
VSYNC	1	D8	E10	I/O	Vertical Sync for Video Mode.
VFRM					Raw Pixel Mode Framing Signal. Indicates first sample of a tile when asserted high.
HSYNC	1	D9	E11	I/O	Horizontal Sync for Video Mode.
VRDY				O	Raw Pixel Mode Ready Signal.

Mnemonic	Pins Used	121-Lead Package	144-Lead Package	I/O	Description
FIELD	1	E10	E9	I/O	Field Sync for Video Mode.
VSTRB				I	Raw Pixel Mode Transfer Strobe.
TEST1	1	J6	K12	I	This pin should be connected to ground via a pull-down resistor.
TEST2	1	K9	K11	I	This pin should be connected to ground via a pull-down resistor.
TEST3	1	J10	K10	I	This pin should be connected to ground via a pull-down resistor.
TEST4	1	L6	M9	I	This pin should be connected to ground via a pull-down resistor.
TEST5	1	K10	L10	O	No Connect.
VDD		A3, A8, D7, H7	B6, B7, C6, C7, D6, D7, J6, J7, K6, K7, L6, L7	V	Positive Supply for Core.
DGND		A1, A11, A4, A9, C1, C11, D6, E1, E5 to E7, E11, F1, F5 to F7, F11, G1, G5 to G7, G11, H6, J1, J11, K11, L1, L8, L11	A1, A5 to A8, A12, B5, B8, C5, C8, D5, D8, E4 to E8, F5 to F8, G5 to G9, H5 to H9, J5, J8 to J9, K5, K8, L5, L8, M1, M5 to M8, M11, M12	GND	Ground.
PLLVD	1	L10	M10	V	Positive Supply for PLL.
IOVDD		B6, C6, C8, D5, E8, G8, H5, J5, K5, K6, K7	B4, B9, C4, C9, D4, D9, K4, K9, L4, L9	V	Positive Supply for I/O.

THEORY OF OPERATION

The input video or pixel data is passed on to the ADV202's pixel interface, where samples are de-interleaved and passed on to the wavelet engine, which decomposes each tile or frame into subbands using the 5/3 or 9/7 filters. The resulting wavelet coefficients are then written to internal memory. Next, the entropy codecs code the image data so it conforms to the JPEG2000 standard. An internal DMA provides high bandwidth memory-to-memory transfers, as well as high performance transfers between functional blocks and memory.

WAVELET ENGINE

The ADV202 provides a dedicated wavelet transform processor based on Analog Devices' proven and patented SURF technology. This processor can perform up to six wavelet decomposition levels on a tile. In encode mode, the wavelet transform processor takes in uncompressed samples, performs the wavelet transform and quantization, and writes the wavelet coefficients in all frequency subbands to internal memory. Each of these subbands is then further broken down into code blocks. The code-block dimensions can be user-defined and are used by the wavelet transform processor to organize the wavelet coefficients into code blocks when writing to internal memory. Each completed code block is then entropy coded by one of the entropy codecs.

In decode mode, wavelet coefficients are read from internal memory and recomposed into uncompressed samples.

ENTROPY CODECS

The entropy codec block performs context modeling and arithmetic coding on a code block of the wavelet coefficients. Additionally, this block performs the distortion metric calculations during compression that are required for optimal rate and distortion performance. Because the entropy coding process is the most computationally intensive operation in the JPEG2000 compression process, three dedicated hardware entropy codecs are provided on the ADV202.

EMBEDDED PROCESSOR SYSTEM

The ADV202 incorporates an embedded 32-bit RISC processor. This processor is used for configuration, control, and management of the dedicated hardware functions, as well as for parsing and generating the JPEG2000 code stream. The processor system includes memory for both program and data memory, an interrupt controller, standard bus interfaces, and other hardware functions such as timers and counters.

MEMORY SYSTEM

The memory system's main function is to manage wavelet coefficient data, interim code-block attribute data, and temporary work space for creating, parsing, and storing the JPEG2000 code stream. The memory system can also be used for program and data memory for the embedded processor.

INTERNAL DMA ENGINE

The internal DMA engine provides high bandwidth memory-to-memory transfers, as well as high performance transfers between memory and functional blocks. This function is critical for high speed generation and parsing the code stream.

ADV202 INTERFACE

There are several possible modes to interface to the ADV202 using the VDATA bus and the HDATA bus or the HDATA bus alone.

VIDEO INTERFACE (VDATA BUS)

The video interface can be used in applications in which uncompressed pixel data is on a separate bus from compressed data. For example, it is possible to use the VDATA bus to input uncompressed video while using the HDATA bus to output the compressed data. This interface is ideal for applications requiring very high throughput such as live video capture.

Optionally, the ADV202 can compress ITU.R-BT656 resolution video on a field-by-field basis or on a two-fields-combined basis, which yields significantly more efficient compression performance. Additionally, high definition digital video such as SMPTE274M (1080i) is supported using two or more ADV202 devices.

The video interface can support video data or still image data input/output, 8-, 10-, and 12-bit single or multiplexed components. The VDATA interface supports digital video in YCbCr format or single component format. YCbCr data must be in 4:2:2 format.

Video data can be input/output in several different modes on the VDATA bus, as described in Table 18. In all these modes, the pixel clock must be input on the VCLK pin.

Table 18. Video Input/Output Modes

Mode	Description
EAV/SAV	Accepts video with embedded EAV/SAV codes, where the YCbCr data is interleaved onto a single bus.
HVF	Accepts video data accompanied with separate H, V, and F signals where YCbCr data is interleaved onto a single bus.
Raw Video	Used for still picture data and nonstandard video. VFRM, VSTRB, and VRDY are used to program the dimensions of the image.

HOST INTERFACE (HDATA BUS)

The ADV202 can connect directly to a wide variety of host processors and ASICs using an asynchronous SRAM-style interface, DMA accesses, or streaming mode (JDATA) interface. The ADV202 supports 16- and 32-bit buses for control and 8-, 16-, and 32-bit buses for data transfer.

The control and data channel bus widths can be specified independently, which allows the ADV202 to support applications that require control and data buses of different widths.

The host interface is used for configuration, control, and status functions, as well as for transferring compressed data streams. It can be used for uncompressed data transfers in certain modes. The host interface can be shared by as many as four concurrent data streams in addition to control and status communications. The data streams are

- Uncompressed tile data (for example, still image data)
- Fully encoded JPEG2000 code stream (or unpackaged code blocks)
- Code-block attributes

The ADV202 uses big endian byte alignment for 16- and 32-bit transfers. All data is left-justified (MSB).

Pixel Input on the Host Interface

Pixel input on the host interface supports 8-, 10-, 12-, 14-, and 16-bit raw pixel data formats. It can be used for pixel (still image) input/output or compressed video output. Because there are no timing codes or sync signals associated with the input data on the host interface, dimension registers and internal counters are used and must be programmed to indicate the start and end of the frame. See the [technical note on using HIPI mode](#) for details on how to use the ADV202 in this mode.

Host Bus Configuration

For maximum flexibility, the host interface provides several configurations to meet particular system requirements. The default bus mode uses the same pins to transfer control, status, and data to and from the ADV202. In this mode, the ADV202 can support 16- and 32-bit control transfers and 8-, 16-, and 32-bit data transfers. The size of these buses can be selected independently, allowing, for example, a 16-bit microcontroller to configure and control the ADV202 while still providing 32-bit data transfers to an ASIC or external memory system.

DIRECT AND INDIRECT REGISTERS

To minimize pin count and cost, the number of address pins has been limited to four, which yields a total direct address space of 16 locations. These locations are most commonly used by the external controller and are, therefore, accessible directly. All other registers in the ADV202 can be accessed indirectly through the IADDR and IDATA registers.

CONTROL ACCESS REGISTERS

With the exception of the indirect address and data registers (IADDR and IDATA), all control/status registers in the ADV202 are 16 bits wide and are half-word (16-bit) addressable only. When 32-bit host mode is enabled, the upper 16 bits of the HDATA bus are ignored on writes and return all 0s on reads of 16-bit registers.

PIN CONFIGURATION AND BUS SIZES/MODES

The ADV202 provides a wide variety of control and data configurations, which allows it to be used in many applications with little or no glue logic. The following modes are configured using the BUSMODE register. In the following descriptions, *host* refers to normal addressed accesses ($\overline{\text{CS}}/\text{RD}/\text{WR}/\text{ADDR}$) and *data* refers to external DMA accesses ($\overline{\text{DREQ}}/\text{DACK}$).

32-Bit Host/32-Bit Data

In this mode, the HDATA[31:0] pins provide full 32-bit wide data accesses to PIXEL, CODE, and ATTR FIFOs. The expanded video interface (VDATA) is not available in this mode.

16-Bit Host/32-Bit Data

This mode allows a 16-bit host to configure and communicate with the ADV202 while still allowing 32-bit accesses to the PIXEL, CODE, and ATTR FIFOs using the external DMA capability.

All addressed host accesses are 16 bits and, therefore, use only the HDATA[15:0] pins. The HDATA[31:16] pins provide the additional 16 bits necessary to support the 32-bit external DMA transfers to and from the FIFOs only. The expanded video interface (VDATA) is not available in this mode.

16-Bit Host/16-Bit Data

This mode uses 16-bit transfers, if used for host or external DMA data transfers. This mode allows for the use of the extended pixel interface modes.

16-Bit Host/8-Bit Data (JDATA Bus Mode)

This mode provides separate data input/output and host control interface pins. Host control accesses are 16 bits and use HDATA[15:0], while the dedicated data bus uses JDATA[7:0].

JDATA uses a valid/hold synchronous transfer protocol. The direction of the JDATA bus is determined by the mode of the ADV202. If the ADV202 is encoding (compression), JDATA[7:0] is an output. If the ADV202 is decoding (decompression), JDATA[7:0] is an input. Host control accesses remain asynchronous (also refer to the JDATA Mode section).

STAGE REGISTER

Because the ADV202 contains both 16-bit and 32-bit registers and its internal memory is mapped as 32-bit data, a mechanism has been provided to allow 16-bit hosts to access these registers and memory locations using the stage register (STAGE).

STAGE is accessed as a 16-bit register using HDATA[15:0]. Prior to writing to the desired register, the stage register must be written with the upper (most significant) half-word.

When the host subsequently writes the lower half-word to the desired control register, HDATA is combined with the previously staged value to create the required 32-bit value that is written. When a register is read, the upper (most significant) half-word is returned immediately on HDATA and the lower half-word can be retrieved by reading the stage register on a subsequent access. For details on using the stage register, see the [ADV202 User's Guide](#).

Note that the stage register does not apply to the three data channels (PIXEL, CODE, and ATTR). These channels are always accessed at the specified data width and do not require the use of the stage register.

JDATA MODE

JDATA mode is typically used only when the dedicated video interface (VDATA) is also enabled. This mode allows code stream data (compressed data compliant with JPEG2000) to be input or output on a single dedicated 8-bit bus (JDATA[7:0]). The bus is always an output during compression operations and is an input during decompression.

A 2-pin handshake is used to transfer data over this synchronous interface. VALID is used to indicate that the ADV202 is ready to provide or accept data and is always an output. HOLD is always an input and is asserted by the host if it cannot accept/provide data. For example, JDATA mode allows real-time applications, in which pixel data is input over the VDATA bus while the compressed data stream is output over the JDATA bus.

EXTERNAL DMA ENGINE

The external DMA interface is provided to enable high bandwidth data I/O between an external DMA controller and the ADV202 data FIFOs. Two independent DMA channels can each be assigned to any one of the three data stream FIFOs (PIXEL, CODE, or ATTR).

The controller supports asynchronous DMA using a data-request/data-acknowledge ($\overline{\text{DREQ}}/\text{DACK}$) protocol in either single or burst access modes. Additional functionality is provided for single address compatibility (fly-by) and dedicated chip select (DCS) modes.

INTERNAL REGISTERS

This section describes the internal registers of the ADV202.

DIRECT REGISTERS

The ADV202 has 16 direct registers, as listed in Table 19.

The direct registers are accessed over the ADDR[3:0], HDATA[31:0], CS, RD, WR, and ACK pins.

The host must first initialize the direct registers before any application-specific operation can be implemented.

For additional information on accessing and configuring these registers, see the [ADV202 User's Guide](#).

Table 19. Direct Registers

Address	Name	Description
0x00	PIXEL	Pixel FIFO Access Register
0x01	CODE	Compressed Code Stream Access Register
0x02	ATTR	Attribute FIFO Access Register
0x03	Reserved	Reserved
0x04	CMDSTA	Command Stack
0x05	EIRQIE	External Interrupt Enabled
0x06	EIRQFLG	External Interrupt Flags
0x07	SWFLAG	Software Flag Register
0x08	BUSMODE	Bus Mode Configuration Register
0x09	MMODE	Miscellaneous Mode Register
0x0A	STAGE	Staging Register
0x0B	IADDR	Indirect Address Register
0x0C	IDATA	Indirect Data Register
0x0D	BOOT	Boot Mode Register
0x0E	PLL_HI	PLL Control Register—High Byte
0x0F	PLL_LO	PLL Control Register—Low Byte

INDIRECT REGISTERS

In certain modes, such as custom-specific input format or HIPI mode, indirect registers must be accessed by the user through the use of the IADDR and IDATA registers. The indirect register address space starts at Internal Address 0xFFFF0000.

Both 32-bit and 16-bit hosts can access the indirect registers. 32-bit hosts use the IADDR and IDATA registers, while the 16-bit hosts use IADDR, IDATA, and the stage register.

For additional information on accessing and configuring these registers, see the [ADV202 User's Guide](#).

Table 20. Indirect Registers

Address	Name	Description
0xFFFF0400	PMODE1	Pixel/Video Format
0xFFFF0404	COMP_CNT_STATUS	Horizontal Count
0xFFFF0408	LINE_CNT_STATUS	Vertical Count
0xFFFF040C	XTOT	Total Samples per Line
0xFFFF0410	YTOT	Total Lines per Frame
0xFFFF0414	F0_START	Start Line of Field 0 [F0]
0xFFFF0418	F1_START	Start Line of Field 1 [F1]
0xFFFF041C	V0_START	Start of Active Video Field 0 [F0]
0xFFFF0420	V1_START	Start of Active Video Field 1 [F1]
0xFFFF0424	V0_END	End of Active Video Field 0 [F0]
0xFFFF0428	V1_END	End of Active Video Field 1 [F1]
0xFFFF042C	PIXEL_START	Horizontal Start of Active Video
0xFFFF0430	PIXEL_END	Horizontal End of Active Video
0xFFFF0440	MS_CNT_DEL	Master/Slave Delay
0xFFFF0444	Reserved	Reserved
0xFFFF0448	PMODE2	Pixel Mode 2
0xFFFF044C	VMODE	Video Mode
0xFFFF1408	EDMOD0	External DMA Mode Register 0
0xFFFF140C	EDMOD1	External DMA Mode Register 1
0xFFFF1410	FFTHRP	FIFO Threshold for Pixel FIFO
0xFFFF1414	Reserved	Reserved
0xFFFF1418	Reserved	Reserved
0xFFFF141C	FFTHRC	FIFO Threshold for CODE FIFO
0xFFFF1420	FFTHRA	FIFO Threshold for ATTR FIFO
0xFFFF1428 to 0xFFFF14FC	Reserved	Reserved

PLL

The ADV202 uses the PLL_HI and PLL_LO direct registers to configure the PLL. Any time the PLL_LO register is modified, the host must wait at least 20 μs before reading or writing to any other register. If this delay is not implemented, erratic behavior could result.

The PLL can be programmed to have any possible final multiplier value as long as

- JCLK > 50 MHz and < 150 MHz (144-lead version).
- JCLK > 50 MHz and < 135 MHz (144-lead version).
- JCLK > 50 MHz and < 115 MHz (121-lead version).
- HCLK < 108 MHz (144-lead, 150 MHz version).
- HCLK < 100 MHz (144-lead, 135 MHz version).
- HCLK < 81 MHz (121-lead version).
- JCLK ≥ 2 × VCLK for single-component input.
- JCLK ≥ 2 × VCLK for YCrCb [4:2:2] input.
- In JDATA mode (JDATA), JCLK must be 4 × MCLK or higher.
- For de-interlaced modes, JCLK must be ≥ 4 × MCLK.

- The maximum burst frequency for external DMA modes is ≤0.36 JCLK.
- For MCLK frequencies greater than 50 MHz, the input clock divider must be enabled, that is, IPD set to 1.
- IPD cannot be enabled for MCLK frequencies below 20 MHz.

To achieve the lowest power consumption, an MCLK frequency of 27 MHz is recommended for a standard definition CCIR656 input. The PLL circuit is recommended to have a multiplier of 3. This sets JCLK and HCLK to 81 MHz.

Figure 23. PLL Architecture and Control Functions

Table 21. Recommended PLL Register Settings

IPD	LFB	PLLMULT	HCLKD	HCLK	JCLK
0	0	N	0	N × MCLK	N × MCLK
0	0	N	1	N × MCLK/2	N × MCLK
0	1	N	0	2 × N × MCLK	2 × N × MCLK
0	1	N	1	N × MCLK	2 × N × MCLK
1	0	N	0	N × MCLK/2	N × MCLK/2
1	0	N	1	N × MCLK/4	N × MCLK/2
1	1	N	0	N × MCLK	N × MCLK
1	1	N	1	N × MCLK/2	N × MCLK

Table 22. Recommended Values for PLL_HI and PLL_LO Registers

Video Standard	CLKIN Frequency on MCLK	PLL_HI	PLL_LO
SMPTE125M or ITU-R.BT656 (NTSC or PAL)	27 MHz	0x0008	0x0004
SMPTE293M (525p)	27 MHz	0x0008	0x0004
ITU-R.BT1358 (625p)	27 MHz	0x0008	0x0004
SMPTE274M (1080i)	74.25 MHz	0x0008	0x0084

HARDWARE BOOT

The boot mode can be configured via hardware using the CFG pins or via software (see the *ADV202 User's Guide*). The first boot mode after power-up is set by the CFG pins. Only Boot Mode 2, Boot Mode 4, and Boot Mode 6, described in Table 23, are available via hardware.

Table 23. Hardware Boot Modes

Boot Mode	Settings	Description
Hardware Boot Mode 2	CFG[1] tied high, CFG[2] tied low	No-Boot Host Mode. ADV202 does not boot, but all internal registers and memory are accessible through normal host I/O operations. For details, see the <i>ADV202 User's Guide</i> and the <i>Getting Started with the ADV202</i> application note.
Hardware Boot Mode 4	CFG[1] tied low, CFG[2] tied high	SoC Boot Mode.
Hardware Boot Mode 6	CFG[1] and CFG[2] tied high	Reserved.

VIDEO INPUT FORMATS

The ADV202 supports a wide variety of formats for uncompressed video and still image data. The actual interface and bus modes selected for transferring uncompressed data dictates the allowed size of the input data and the number of samples transferred with each access.

The host interface can support 8-, 10-, 12-, 14-, and 16-bit data formats. The video interface can support video data or still image data input/output. Supported formats are 8-, 10-, 12-, or 16-bit

single component or YCbCr 4:2:2 formats. See the [ADV202 User's Guide](#) for details. All formats can support less precision than provided by specifying the actual data width/precision in the PMODE register.

The maximum allowable data input rate is limited by using irreversible or reversible compression modes and the data width (or precision) of the input samples. Use Table 24 and Table 25 to determine the maximum data input rate.

Table 24. Maximum Pixel Data Input Rates

Interface	Compression Mode	Input Format	Input Rate Limit Active Resolution (MSPS) ¹	Approx Min Output Rate, Compressed Data ² (Mbps)	Approx Max Output Rate, Compressed Data ³ (Mbps)

¹ Input rate limits for HDATA can be less for certain applications depending on input picture size and content, host interface settings, and DMA transfer settings. Values in brackets refer to the 135 MHz speed grade version of the ADV202.

² Minimum guaranteed sustained output rate or minimum sustainable compression rate (input rate/minimum peak output rate).

³ Maximum peak output rate, or output rate above this value is not possible.

Table 25. Maximum Supported Tile Width for Data Input on HDATA and VDATA Buses

Compression Mode	Input Format	Tile/Precinct Maximum Width
9/7i	Single-component	2048
9/7i	Two-component	1024 each
9/7i	Three-component	1024 (Y)
5/3i	Single-component	4096
5/3i	Two-component	2048 (each)
5/3i	Three-component	2048 (Y)
5/3r	Single-component	4096
5/3r	Two-component	2048
5/3r	Three-component	1024

APPLICATIONS

This section describes typical video applications for the ADV202 JPEG2000 video processor.

ENCODE—MULTICHIP MODE

Due to the data input rate limitation (see Table 24), an 1080i application requires at least two ADV202s to encode or decode full-resolution 1080i video. In encode mode, the ADV202 accepts Y and CbCr data on separate buses. The input data must be in EAV/SAV format. An encode example is shown in Figure 24.

In decode mode, a master/slave configuration (as shown in Figure 25) or a slave/slave configuration can be used to synchronize the outputs of the two ADV202s. See AN-796 [ADV202 Multichip Application](#) application note for details on how to configure the ADV202s in a multichip application.

Applications that have two separate VDATA outputs sent to an FPGA or buffer before they are sent to an encoder do not require synchronization at the ADV202 outputs

Figure 24. Encode—Multichip Application

DECODE—MULTICHIP MASTER/SLAVE

In a master/slave configuration, it is expected that the master HVF outputs are connected to the slave HVF inputs and that each SCOMM[5] pin is connected to the same GPIO on the host.

In a slave/slave configuration, the common HVF for both ADV202s is generated by an external house sync, and each SCOMM[5] is connected to the same GPIO output on the host. SWIRQ1, Software Interrupt 1 in the EIRQIE register, must be unmasked on both devices to enable multichip mode.
