ADG436

FEATURES

44 V supply maximum ratings V_{SS} to V_{DD} analog signal range Low on resistance (12 Ω typ) Low ΔR_{ON} (3 Ω max) Low Ron match (2.5 Ω max) Low power dissipation Fast switching times

 $t_{ON} < 175 \text{ ns}$

toff < 145 ns

Low leakage currents (5 nA max) Low charge injection (10 pC) **Break-before-make switching action**

APPLICATIONS

Audio and video switching **Battery-powered systems Test equipment Communications systems**

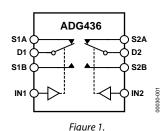

GENERAL DESCRIPTION

The ADG436 is a monolithic CMOS device comprising two independently selectable SPDT switches. It is designed on an LC²MOS process, which provides low power dissipation yet gives high switching speed and low on resistance.

The on resistance profile is very flat over the full analog input range, ensuring good linearity and low distortion when switching audio signals. High switching speed also makes the part suitable for video signal switching. CMOS construction ensures ultralow power dissipation, making the part ideally suited for portable and battery-powered instruments.

Each switch conducts equally well in both directions when on and has an input signal range which extends to the power supplies. In the off condition, signal levels up to the supplies are blocked. All switches exhibit break-before-make switching action for use in multiplexer applications. Inherent in the design is low charge injection for minimum transients when switching the digital inputs.

FUNCTIONAL BLOCK DIAGRAM

PRODUCT HIGHLIGHTS

- Extended signal range. The ADG436 is fabricated on an enhanced LC²MOS process, giving an increased signal range that extends to the supply rails.
- Low power dissipation.
- 3. Low Ron.
- Single-supply operation. For applications where the analog signal is unipolar, the ADG436 can be operated from a single rail power supply.

 $^{^{\}rm 1}$ Overvoltages at IN, S, or D are clamped by internal diodes. Current should be limited to the maximum ratings given.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Only one absolute maximum rating may be applied at any one time.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

APPLICATIONS INFORMATION

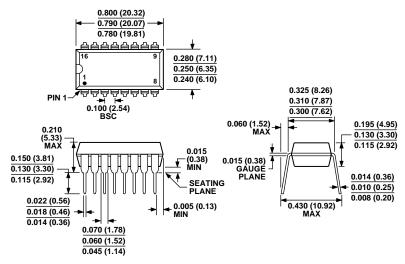

ADG436 SUPPLY VOLTAGES

The ADG436 can operate from a dual or single supply. V_{SS} should be connected to GND when operating with a single supply. When using a dual supply, the ADG436 can also operate with unbalanced supplies, for example V_{DD} = 20 V and V_{SS} = -5 V. The only restrictions are that V_{DD} to GND must not exceed 30 V, V_{SS} to GND must not drop below -30 V, and V_{DD} to V_{SS} must not exceed +44 V. It is important to remember that the ADG436 supply voltage directly affects the input signal range, the switch on resistance and the switching times of the part. The effects of the power supplies on these characteristics can be clearly seen from the Typical Performance Characteristics curves.

POWER-SUPPLY SEQUENCING

When using CMOS devices, care must be taken to ensure correct power-supply sequencing. Incorrect power-supply sequencing can result in the device being subjected to stresses beyond those listed in the Absolute Maximum Ratings. Always sequence $V_{\rm DD}$ on first followed by $V_{\rm SS}$ and the logic signals. An external signal can then be safely presented to the source or drain of the switch.
