

FEATURES

- Gain: 21.5 dB typical
- Output power for 1 dB compression (P1dB): 25 dBm typical
- Saturated output power (P_{SAT}): 26.5 dBm typical
- Output third-order intercept (OIP3): 30 dBm typical
- Input return loss: 12 dB typical
- Output return loss: 12 dB typical
- DC supply: 4 V at 450 mA
- No external matching required
- Die size: 3.599 mm × 1.999 mm × 0.05 mm

APPLICATIONS

- E-band communication systems
- High capacity wireless backhaul radio systems
- Test and measurement

GENERAL DESCRIPTION

The HMC7543 is an integrated E-band gallium arsenide (GaAs), pseudomorphic (pHEMT), monolithic microwave integrated circuit (MMIC), medium power amplifier with a temperature compensated on-chip power detector that operates from 71 GHz to 76 GHz. The HMC7543 provides 21.5 dB of gain, 25 dBm of output power at 1 dB compression, and 26.5 dBm of saturated output power at 20% power added efficiency (PAE) from a 4 V power supply. The HMC7543 exhibits excellent linearity and is optimized for E-band communications and high capacity wireless backhaul radio systems. The amplifier configuration and high gain make it an excellent candidate for last stage signal amplification before the antenna. All data is taken with the chip in a 50 Ω test fixture connected via a 3 mil wide × 0.5 mil thick × 7 mil long ribbon on each port.

REVISION HISTORY

2/16—Revision A: Initial Version

SPECIFICATIONS

$T_A = 25^\circ\text{C}$, $V_{DDx} = 4\text{ V}$, $I_{DD} = 450\text{ mA}$, unless otherwise noted.

Table 1.

Parameter	Min	Typ	Max	Unit
OPERATING CONDITIONS				
RF Frequency Range	71		76	GHz
PERFORMANCE				
Gain	19	21.5		dB
Gain Variation over Temperature		0.02		dB/ $^\circ\text{C}$
Output Power for 1 dB Compression (P1dB)	22.5	25		dBm
Saturated Output Power (P_{SAT})		26.5		dBm
Output Third-Order Intercept (OIP3) at Maximum Gain ¹		30		dBm
Input Return Loss		12		dB
Output Return Loss		12		dB
POWER SUPPLY				
Total Supply Current (I_{DD}) ²		450		mA

¹ Data taken at output power (P_{OUT}) = 12 dBm per tone, 1 MHz spacing.

² Adjust V_{GGx} from -2 V to 0 V to achieve the total drain current (I_{DD}) = 450 mA.

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
Drain Bias Voltage (V_{DD1} to V_{DD4})	4.5 V
Gate Bias Voltage (V_{GG1} to V_{GG4})	-3 V to 0 V
Maximum Junction Temperature (to Maintain 1 Million Hours Mean Time to Failure (MTTF))	175°C
Operating Temperature Range	-55°C to +85°C
Storage Temperature Range	-65°C to +150°C

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

Table 3. Thermal Resistance

Package Type	θ_{JC} ¹	Unit
25-Pad Bare Die [CHIP]	48.33	°C/W

¹ Based on ABLETHERM® 2600BT as die attach epoxy with thermal conductivity of 20 W/mK.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

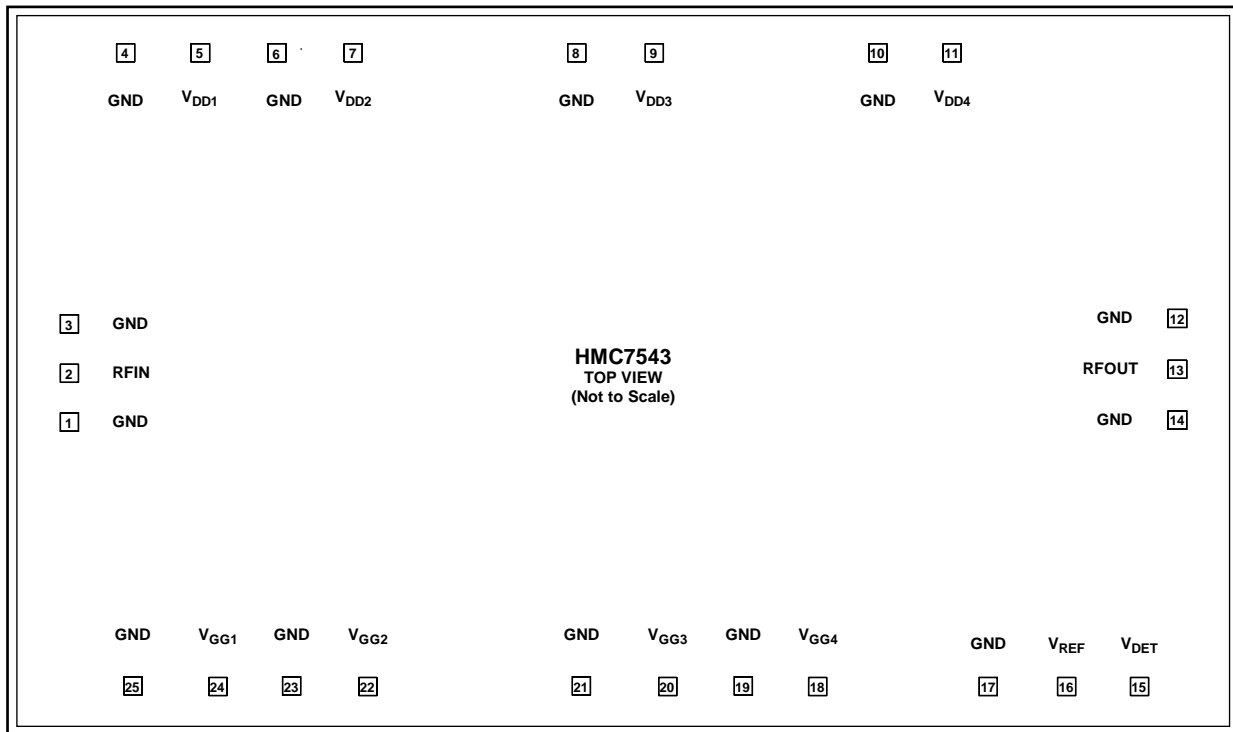

Figure 2. Pad Configuration

Table 4. Pad Function Descriptions

Pad No.	Mnemonic	Description
1, 3, 4, 6, 8, 10, 12, 14, 17, 19, 21, 23, 25	GND	Ground Connection (See Figure 3).
2	RFIN	RF Input. DC couple RFIN and match it to 50 Ω (See Figure 4).
5, 7, 9, 11	V _{DD1} to V _{DD4}	Drain Bias Voltage for the Power Amplifier (See Figure 5).
13	RFOUT	RF Output. AC couple RFOUT and match it to 50 Ω (see Figure 6).
15	V _{DET}	Detector Voltage for the Power Detector (See Figure 7). V _{DET} is the dc voltage representing the RF output power rectified by the diode, which is biased through an external resistor. Refer to the typical application circuit for the required external components (see Figure 40).
16	V _{REF}	Reference Voltage for the Power Detector (See Figure 7). V _{REF} is the dc bias of the diode biased through an external resistor used for temperature compensation of V _{DET} . Refer to the typical application circuit for the required external components (see Figure 40).
18, 20, 22, 24	V _{GG4} to V _{GG1}	Gate Bias Voltage for the Power Amplifier (See Figure 8). For the required external components, see Figure 40.
Die Bottom	GND	Ground. The die bottom must be connected to the RF/dc ground (see Figure 3).

THEORY OF OPERATION

The circuit architecture of the HMC7543 power amplifier is shown in Figure 39. The HMC7543 uses four cascaded gain stages to form an amplifier with a combined gain of 21.5 dB and a saturated output power (P_{SAT}) of 26.5 dBm. At the output of the last stage, a coupler taps off a small portion of the output signal. The coupled signal is presented to an on-chip diode

detector for external monitoring of the output power. A matched reference diode is included to help correct for detector temperature dependencies. See the application circuit shown in Figure 40 for further details on biasing the different blocks and using the detector features.

Figure 39. Power Amplifier Circuit Architecture

13423-039

TYPICAL APPLICATION CIRCUIT

A typical application circuit for the HMC7543 is shown in Figure 40. Combine supply lines as shown in the application circuit schematic to minimize external component count and simplify power supply routing (see Figure 40).

The HMC7543 uses several amplifier, detector, and attenuator stages. All stages use depletion mode pHEMT transistors. It is important to follow the following power-up bias sequence to avoid transistor damage.

1. Apply a -2 V bias to the V_{GG1} to V_{GG4} pads.
2. Apply 4 V to the V_{DD1} to V_{DD4} pads.
3. Adjust V_{GG1} to V_{GG4} between -2 V and 0 V to achieve a total amplifier drain current of 450 mA .

To power down the HMC7543, follow the reverse procedure. For additional guidance on general bias sequencing, see the [MMIC Amplifier Biasing Procedure](#) application note.

ASSEMBLY DIAGRAM

Figure 41. Assembly Diagram

13423-041

MOUNTING AND BONDING TECHNIQUES FOR MILLIMETERWAVE GaAs MMICS

Attach the die directly to the ground plane eutectically or with conductive epoxy.

To bring RF to and from the chip, use 50 Ω microstrip transmission lines on 0.127 mm (5 mil) thick alumina thin film substrates (see Figure 42).

Figure 42. Routing RF Signals

To minimize bond wire length, place microstrip substrates as close to the die as possible. Typical die to substrate spacing is 0.076 mm to 0.152 mm (3 mil to 6 mil).

HANDLING PRECAUTIONS

To avoid permanent damage, adhere to the following precautions.

Storage

All bare die ship in either waffle or gel-based ESD protective containers, sealed in an ESD protective bag. After opening the sealed ESD protective bag, all die must be stored in a dry nitrogen environment.

Cleanliness

Handle the chips in a clean environment. Never use liquid cleaning systems to clean the chip.

Static Sensitivity

Follow ESD precautions to protect against ESD strikes.

Transients

Suppress instrument and bias supply transients while bias is applied. To minimize inductive pickup, use shielded signal and bias cables.

General Handling

Handle the chip on the edges only using a vacuum collet or with a sharp pair of bent tweezers. Because the surface of the chip has fragile air bridges, never touch the surface of the chip with a vacuum collet, tweezers, or fingers.

MOUNTING

The chip is back metallized and can be die mounted with gold/tin (AuSn) eutectic preforms or with electrically conductive epoxy. The mounting surface must be clean and flat.

Eutectic Die Attach

It is best to use an 80% Au/20% Sn preform with a work surface temperature of 255°C and a tool temperature of 265°C. When hot 90% nitrogen/10% hydrogen gas is applied, maintain tool tip temperature at 290°C. Do not expose the chip to a temperature greater than 320°C for more than 20 sec. No more than 3 sec of scrubbing is required for attachment.

Epoxy Die Attach

ABLETHERM 2600BT is recommended for die attachment. Apply a minimum amount of epoxy to the mounting surface so that a thin epoxy fillet is observed around the perimeter of the chip after placing it into position. Cure the epoxy per the schedule provided by the manufacturer.

WIRE BONDING

RF bonds made with 3 mil \times 0.5 mil gold ribbon are recommended for the RF ports. These bonds must be thermosonically bonded with a force of 40 g to 60 g. DC bonds of 1 mil (0.025 mm) diameter, thermosonically bonded, are recommended. Create ball bonds with a force of 40 g to 50 g and wedge bonds with a force of 18 g to 22 g. Create all bonds with a nominal stage temperature of 150°C. Apply a minimum amount of ultrasonic energy to achieve reliable bonds. Keep all bonds as short as possible, less than 12 mil (0.31 mm).

OUTLINE DIMENSIONS
