## feATURES

- 8-Channel Simultaneous Sampling ADC
- 73.1dB SNR
- 88dB SFDR
- Low Power: $140 \mathrm{~mW} / 113 \mathrm{~mW} / 94 \mathrm{~mW}$ per Channel
- Single 1.8V Supply
- Serial LVDS Outputs: 1 or 2 Bits per Channel
- Selectable Input Ranges: $1 \mathrm{~V}_{\mathrm{p}-\mathrm{p}}$ to $2 \mathrm{~V}_{\mathrm{p}-\mathrm{p}}$
- 800MHz Full Power Bandwidth S/H
- Shutdown and Nap Modes
- Serial SPI Port for Configuration
- Internal Bypass Capacitance, No External

Components

- 140 -Pin ( $11.25 \mathrm{~mm} \times 9 \mathrm{~mm}$ ) BGA Package

## APPLICATIOOS

- Communications
- Cellular Base Stations
- Software Defined Radios
- Portable Medical Imaging
- Multichannel Data Acquisition
- Nondestructive Testing

## DESCRIPTIOn

The LTM ${ }^{\ominus 011-14 / L T M 9010-14 / L T M 9009-14 ~ a r e ~ 8-c h a n-~}$ nel, simultaneous sampling 14 -bit A/D converters designed for digitizing high frequency, wide dynamic range signals. AC performance includes 73.1 dB SNR and 88 dB spurious free dynamic range (SFDR). Low power consumption per channel reduces heat in high channel count applications. Integrated bypass capacitance and flow-through pinout reduces overall board space requirements.
DC specs include $\pm 1$ LSB INL (typ), $\pm 0.3$ LSB DNL (typ) and no missing codes over temperature. The transition noise is a low 1.2LSB ${ }_{\text {rms }}$.
The digital outputs are serial LVDS to minimize the number of data lines. Each channel outputs two bits at a time (2-lane mode). At lower sampling rates there is a one bit per channel option ( 1 -lane mode).
The ENC+ and ENC- inputs may be driven differentially or single-ended with a sine wave, PECL, LVDS, $\Pi \mathrm{L}$, or CMOS inputs. An internal clock duty cycle stabilizer allows high performance at full speed for a wide range of clock duty cycles.

[^0]
## TYPICAL APPLICATION

LTM9011-14, 125Msps, $2-$ Tone FFT, $\mathrm{f}_{\mathrm{IN}}=70 \mathrm{MHz}$ and 75 MHz

## absolute maximum ratings

(Notes 1, 2)
Supply Voltages
$V_{D D}, O V_{D D}$. $\qquad$ -0.3 V to 2 V

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.
Note 2: All voltage values are with respect to GND (unless otherwise noted).
Note 3: When these pin voltages are taken below GND or above $V_{D D}$, they will be clamped by internal diodes. This product can handle input currents of greater than 100 mA below $G N D$ or above $\mathrm{V}_{\mathrm{DD}}$ without latchup.
Note 4: When these pin voltages are taken below GND they will be clamped by internal diodes. When these pin voltages are taken above $V_{D D}$ they will not be clamped by internal diodes. This product can handle input currents of greater than 100 mA below GND without latchup.
Note 5: $\mathrm{V}_{\mathrm{DD}}=\mathrm{OV}_{\mathrm{DD}}=1.8 \mathrm{~V}$, fsAMPLE $=125 \mathrm{MHz}$ (LTM9011), 105 MHz (LTM9010), or 80MHz (LTM9009), 2 -lane output mode, differential ENC ${ }^{+} /$ $\mathrm{ENC}^{-}=2 \mathrm{~V}_{\mathrm{P}-\mathrm{p}}$ sine wave, input range $=2 \mathrm{~V}_{\mathrm{p}-\mathrm{p}}$ with differential drive, unless otherwise noted.
Note 6: Integral nonlinearity is defined as the deviation of a code from a best fit straight line to the transfer curve. The deviation is measured from the center of the quantization band.

Note 7: Offset error is the offset voltage measured from -0.5 LSB when the output code flickers between 00000000000000 and 1111111111 1111 in 2's complement output mode.
Note 8: Guaranteed by design, not subject to test.
Note 9: $\mathrm{V}_{\mathrm{DD}}=0 \mathrm{~V}_{\mathrm{DD}}=1.8 \mathrm{~V}, \mathrm{f}_{\text {SAMPLE }}=125 \mathrm{MHz}($ LTM9011), 105 MHz (LTM9010), or 80 MHz (LTM9009), 2-lane output mode, differential ENC $^{+} /$ENC $^{-}=2 V_{\text {p-p }}$ sine wave, input range $=2 V_{p-p}$ with differential drive, unless otherwise noted. The supply current and power dissipation specifications are totals for the entire device, not per channel.
Note 10: Recommended operating conditions.
Note 11: The maximum sampling frequency depends on the speed grade of the part and also which serialization mode is used. The maximum serial data rate is 1000 Mbps so $\mathrm{t}_{\text {SER }}$ must be greater than or equal to 1 ns .
Note 12: Near-channel crosstalk refers to Ch. 1 to Ch.2, and Ch. 7 to Ch.8. Far-channel crosstalk refers to Ch. 1 to Ch.7, Ch. 1 to Ch. 8 , Ch. 2 to Ch.7, and Ch. 2 to Ch. 8.

## PIn functions

$\mathrm{A}_{\mathrm{IN} 1^{+}}$(B2): Channel 1 Positive Differential Analog Input. $\mathrm{A}_{\mathrm{IN1}}{ }^{-}$(B1): Channel 1 Negative Differential Analog Input.
$\mathrm{V}_{\text {CM14 }}$ (B3): Common Mode Bias Output, Nominally Equal to $\mathrm{V}_{\mathrm{DD}} / 2 . \mathrm{V}_{\mathrm{CM}}$ should be used to bias the common mode of the analog inputs of channels 1 and $4 . V_{C M}$ is internally bypassed to ground with a $0.1 \mu \mathrm{~F}$ ceramic capacitor. No external capacitance is required.
$\mathrm{A}_{\mathrm{IN2}}{ }^{+}$(C2): Channel 2 Positive Differential Analog Input. $\mathrm{A}_{\mathrm{IN}_{2}}{ }^{-}$(C1): Channel 2 Negative Differential Analog Input. $\mathrm{A}_{\mathrm{IN3}}{ }^{+}$(E2): Channel 3 Positive Differential Analog Input. $\mathrm{A}_{\mathrm{IN3}^{-}}{ }^{-}$(E1): Channel 3 Negative Differential Analog Input.
$\mathrm{V}_{\text {CM23 }}$ (F3): Common Mode Bias Output, Nominally Equal to $V_{D D} / 2 . V_{C M}$ should be used to bias the common mode of the analog inputs of channels 2 and $3 . V_{C M}$ is internally bypassed to ground with a $0.1 \mu \mathrm{~F}$ ceramic capacitor. No external capacitance is required.
$\mathrm{A}_{\text {IN4 }}{ }^{+}$(G2): Channel 4 Positive Differential Analog Input. $\mathrm{A}_{\mathbf{I N}}{ }^{-}$(G1): Channel 4 Negative Differential Analog Input. $\mathrm{A}_{\text {IN5 }}{ }^{+}$(H1): Channel 5 Positive Differential Analog Input. $\mathrm{A}_{\mathbf{I N 5}}{ }^{-}$(H2): Channel 5 Negative Differential Analog Input.
$\mathrm{V}_{\text {CM67 }}$ (J3): Common Mode Bias Output, Nominally Equal to $\mathrm{V}_{\mathrm{DD}} / 2 . \mathrm{V}_{\mathrm{CM}}$ should be used to bias the common mode of the analog inputs of channels 6 and $7 . V_{C M}$ is internally bypassed to ground with a $0.1 \mu \mathrm{~F}$ ceramic capacitor. No external capacitance is required.
$\mathrm{A}_{\text {ING }}{ }^{+}$(K1): Channel 6 Positive Differential Analog Input.
$\mathrm{A}_{\mathbf{I N G}}{ }^{-}$(K2): Channel 6 Negative Differential Analog Input. $\mathrm{A}_{\mathbf{I N} 7^{+}}$(M1): Channel 7 Positive Differential Analog Input. $\mathrm{A}_{\mathrm{IN} 7^{-}}$(M2): Channel 7 Negative Differential Analog Input.
$\mathrm{V}_{\text {CM58 }}$ (N3): Common Mode Bias Output, Nominally Equal to $V_{D D} / 2 . V_{C M}$ should be used to bias the common mode of the analog inputs of channels 5 and $8 . V_{C M}$ is internally bypassed to ground with a $0.1 \mu \mathrm{~F}$ ceramic capacitor. No external capacitance is required.
$\mathrm{A}_{\text {Ins }}{ }^{+}$(N1): Channel 8 Positive Differential Analog Input.
$\mathrm{A}_{\text {IN8 }}{ }^{-}$(N2): Channel 8 Negative Differential Analog Input
VDD (D3, D4, E3, E4, K3, K4, L3, L4): 1.8V Analog Power Supply. $\mathrm{V}_{\mathrm{DD}}$ is internally bypassed to ground with $0.1 \mu \mathrm{~F}$ ceramic capacitors.
ENC ${ }^{+}$(P5): Encode Input. Conversion starts on the rising edge.
ENC ${ }^{-}$(P6): Encode Complement Input. Conversion starts on the falling edge.
$\overline{\mathrm{CSA}}$ (L5): In serial programming mode, (PAR/SER $=0 \mathrm{~V})$, $\overline{\text { CSA }}$ is the serial interface chip select input for registers controlling channels $1,4,5$ and 8 . When $\overline{C S}$ is low, SCK is enabled for shifting data on SDI into the mode control registers. In parallel programming mode (PAR/SER $=V_{D D}$ ), CS selects 2 -lane or 1-lane output mode. $\overline{C S}$ can be driven with 1.8 V to 3.3 V logic.
$\overline{\mathrm{CSB}}$ (M5): In serial programming mode, (PAR/ $\overline{\mathrm{SER}}=\mathrm{OV}$ ), CSB is the serial interface chip select input for registers controlling channels 2, 3, 6 and 7 . When $\overline{\text { CS }}$ is low, SCK is enabled for shifting data on SDI into the mode control registers. In parallel programming mode (PAR/㓞 $=V_{D D}$ ), $\overline{C S}$ selects 2 -lane or 1 -lane output mode. $\overline{C S}$ can be driven with 1.8 V to 3.3 V logic.
SCK (L6): In serial programming mode, (PAR/SER $=0 V$ ), SCK is the serial interface clock input. In parallel programming mode (PAR/SER $\left.=V_{D D}\right)$, SCK selects 3.5 mA or 1.75 mA LVDS output currents. SCK can be driven with 1.8 V to 3.3 V Iogic.

SDI (M6): In serial programming mode, (PAR/侲 = OV), SDI is the serial interface data Input. Data on SDI is clocked into the mode control registers on the rising edge of SCK. In parallel programming mode (PAR/SER = $V_{D D}$ ), SDI can be used to power down the part. SDI can be driven with 1.8 V to 3.3 V logic.
GND (See Pin Configuration Table): ADC Power Ground. Use multiple vias close to pins.

## PIn functions

OV ${ }_{\text {DD }}$ (G9, G10): Output Driver Supply. OV $\mathrm{DD}_{\mathrm{D}}$ is internally bypassed to ground with a $0.1 \mu \mathrm{~F}$ ceramic capacitor.
SDOA (E6): In serial programming mode, (PAR/ $\overline{\mathrm{SER}}=0 \mathrm{~V}$ ), SDOA is the optional serial interface data output for registers controlling channels $1,4,5$ and 8 . Data on SDO is read back from the mode control registers and can be latched on the falling edge of SCK. SDO is an open-drain N -channel MOSFET output that requires an external 2 k pull-up resistor from 1.8 V to 3.3 V . If read back from the mode control registers is not needed, the pull-up resistor is not necessary and SDO can be left unconnected. In parallel programming mode (PAR/位 $\left.=V_{D D}\right)$, SDOA is an input that enables internal $100 \Omega$ termination resistors on the digital outputs of channels $1,4,5$ and 8 . When used as an input, SDO can be driven with 1.8 V to 3.3 V logic through a 1 k series resistor.

SDOB (D6): Serial Data Output Pin for Channels 2, 3, 6 and 7. See description for SDOA.
PAR/佂 (A7): Programming Mode Selection Pin. Connect to ground to enable the serial programming mode. $\overline{\mathrm{CS}} \mathrm{A}$, $\overline{\text { CSB }}$, SCK, SDI, SDOA and SDOB become a serial interface that control the $A / D$ operating modes. Connect to $V_{D D}$ to enable parallel programming mode where $\overline{\mathrm{CS}} \mathrm{A}, \overline{\mathrm{CS}} \mathrm{B}, \mathrm{SCK}$, SDI, SDOA and SDOB become parallel logic inputs that control a reduced set of the A/D operating modes. PAR/ $\overline{\text { SER }}$ should be connected directly to ground or the $V_{D D}$ of the part and not be driven by a logic signal.
$\mathbf{V}_{\text {REF }}$ (B6): Reference Voltage Output. $\mathrm{V}_{\text {REF }}$ is internally bypassed to ground with a $1 \mu \mathrm{~F}$ ceramic capacitor, nominally 1.25 V .
SENSE (C5): Reference Programming Pin. Connecting SENSE to $V_{D D}$ selects the internal reference and a $\pm 1 \mathrm{~V}$ input range. Connecting SENSE to ground selects the internal reference and a $\pm 0.5 \mathrm{~V}$ input range. An external reference between 0.625 V and 1.3 V applied to SENSE selects an input range of $\pm 0.8 \cdot \mathrm{~V}_{\text {SENSE }}$. SENSE is internally bypassed to ground with a $0.1 \mu \mathrm{~F}$ ceramic capacitor.

## LVDS Outputs

All pins in this section are differential LVDS outputs. The output current level is programmable. There is an optional internal $100 \Omega$ termination resistor between the pins of each LVDS output pair.

OUT1A ${ }^{-} /$OUT1A $^{+}$, OUT1B ${ }^{-} /$OUT1B $^{+}$(E7/E8, C8/D8): Serial Data Outputs for Channel 1. In 1-lane output mode only OUT1A ${ }^{-} /$OUT1A $^{+}$are used.

OUT2A$/ 0 U T 2 A^{+}, O U T 2 B^{-} / 0 U T 2 B^{+}$(B8/A8, D7/C7): Serial Data Outputs for Channel 2. In 1-lane output mode only OUT2A-/0UT2A ${ }^{+}$are used.
OUT3A/OUT3A+, OUT3B$/{ }^{+}{ }^{+}{ }^{+}{ }^{+}{ }^{+}$(D10/D9, E10/E9):
Serial Data Outputs for Channel 3. In 1-lane output mode only OUT3A-/0UT3A+ are used.
OUT4A $/$ /OUT4A ${ }^{+}$, OUT4B ${ }^{-} /$OUT4B $^{+}$(C9/C10, F7/F8):
Serial Data Outputs for Channel 4. In 1-lane output mode only OUT4A ${ }^{-} / 0 U T 4 A^{+}$are used.

OUT5A ${ }^{-} /$OUT5A $^{+}$, OUT5B${ }^{-} /$OUT5B $^{+}$(J8/J7, K8/K7): Serial Data Outputs for Channel 5. In 1-lane output mode only OUT5A-/0UT5A ${ }^{+}$are used.

OUT6A/OUT6A ${ }^{+}$, OUT6B$/{ }^{-} /$OUT6B $^{+}$(K9/K10, L9/L10): Serial Data Outputs for Channel 6. In 1-lane output mode only 0UT6A ${ }^{-} / 0 U^{2} 6 A^{+}$are used.
OUT7A ${ }^{-} /$OUT7A $^{+}$, OUT7B ${ }^{-} /$OUT7B $^{+}$(M7/L7, P8/N8): Serial Data Outputs for Channel 7. In 1-lane output mode only OUT7A ${ }^{-} / 0 U T 7 A^{+}$are used.

OUT8A ${ }^{-/ O U T 8 A+}{ }^{+}$, OUT8B${ }^{-} /$OUT8B $^{+}$(L8/M8, M10/M9): Serial Data Outputs for Channel 8. In 1-lane output mode only OUT8A ${ }^{-} / 0 U T 8 A^{+}$are used.

FRA $^{-} /$FRA $^{+}$(H7/H8): Frame Start Outputs for Channels 1, 4, 5 and 8.

FRB $^{-} / \mathbf{F R B}^{+}(\mathbf{J 9} / \mathbf{J 1 0})$ : Frame Start Outputs for Channels 2, 3, 6 and 7.
DCOA $^{-} /$DCOA $^{+}$(G8/G7): Data Clock Outputs for Channels $1,4,5$ and 8.
DCOB $^{-/ D C O B}{ }^{+}$(F10, F9): Data Clock Outputs for Channels 2, 3, 6 and 7 .

## functional block dingram

Figure 1. Figure 1. Functional Block Diagram

## APPLLCATIONS InFORMATION

## CONVERTER OPERATION

The LTM9011-14/LTM9010-14/LTM9009-14 are low power, 8-channel, 14-bit, 125Msps/105Msps/80Msps A/D converters that are powered by a single 1.8 V supply. The analog inputs should be driven differentially. The encode input can be driven differentially for optimal jitter performance, or single-ended for lower power consumption. The digital outputs are serial LVDS to minimize the number of data lines. Each channel outputs two bits at a time (2-lane mode). At lower sampling rates there is a one bit per channel option (1-lane mode). Many additional features can be chosen by programming the mode control registers through a serial SPI port.

## ANALOG INPUT

The analog inputs are differential CMOS sample-and-hold circuits (Figure 2). The inputs should be driven differentially around a common mode voltage set by the appropriate $V_{C M}$ output pins, which are nominally $V_{D D} / 2$. For the 2 V input range, the inputs should swing from $\mathrm{V}_{\mathrm{CM}}-0.5 \mathrm{~V}$ to $\mathrm{V}_{\mathrm{CM}}+0.5 \mathrm{~V}$. There should be $180^{\circ}$ phase difference between the inputs.

The eight channels are simultaneously sampled by a shared encode circuit (Figure 2).

Figure 2. Equivalent Input Circuit. Only One of the Eight Analog Channels Is Shown

## INPUT DRIVE CIRCUITS

## Input Filtering

If possible, there should be an RC low pass filter right at the analog inputs. This lowpass filter isolates the drive circuitry from the A/D sample-and-hold switching, and also limits wideband noise from the drive circuitry. Figure 3 shows an example of an input RC filter. The RC component values should be chosen based on the application's input frequency.

## Transformer Coupled Circuits

Figure 3 shows the analog input being driven by an RF transformer with a center-tapped secondary. The center tap is biased with $V_{\mathrm{CM}}$, setting the $\mathrm{A} / \mathrm{D}$ input at its optimal DC level. At higher input frequencies a transmission line balun transformer (Figures 4 to 6 ) has better balance, resulting in lower $\mathrm{A} / \mathrm{D}$ distortion.

Figure 3. Analog Input Circuit Using a Transformer. Recommended for Input Frequencies from 5 MHz to 70 MHz

## APPLICATIONS INFORMATION

## Amplifier Circuits

Figure 7 shows the analog input being driven by a high speed differential amplifier. The output of the amplifier is AC-coupled to the A/D so the amplifier's output common mode voltage can be optimally set to minimize distortion. See back page for a DC-coupled example.

At very high frequencies an RF gain block will often have lower distortion than a differential amplifier. If the gain block is single-ended, then a transformer circuit (Figures 4 to 6 ) should convert the signal to differential before driving the $A / D$.

T1: MA/COM MABA-007159-000000 T2: COILCRAFT WBC1-1LB
RESISTORS, CAPACITORS ARE 0402 PACKAGE SIZE

Figure 5. Recommended Front End Circuit for Input Frequencies from 170 MHz to 300 MHz

Figure 7. Front End Circuit Using a High Speed Differential Amplifier

## APPLICATIONS INFORMATION

## Reference

The LTM9011-14/LTM9010-14/LTM9009-14 has an internal 1.25 V voltage reference. For a 2 V input range using the internal reference, connect SENSE to $V_{D D}$. For a 1 V input range using the internal reference, connect SENSE to ground. For a 2 V input range with an external reference, apply a 1.25 V reference voltage to SENSE (Figure 9).

The input range can be adjusted by applying a voltage to SENSE that is between 0.625 V and 1.30 V . The input range will then be 1.6 - $V_{\text {SENSE }}$. The reference is shared by all eight ADC channels, so it is not possible to independently adjust the input range of individual channels.
The $\mathrm{V}_{\text {REF }}$, SENSE, REFH and REFL pins are internally bypassed, as shown in Figure 8.

Figure 8. Reference Circuit

Figure 9. Using an External 1.25V Reference

## APPLICATIONS INFORMATION

## Encode Input

The signal quality of the encode inputs strongly affects the $A / D$ noise performance. The encode inputs should be treated as analog signals-do not route them next to digital traces on the circuit board. There are two modes of operation for the encode inputs: the differential encode mode (Figure 10), and the single-ended encode mode (Figure 11).
The differential encode mode is recommended for sinusoidal, PECL, or LVDS encode inputs (Figures 12 and 13).

The encode inputs are internally biased to 1.2 V through 10 k equivalent resistance. The encode inputs can be taken above $\mathrm{V}_{\mathrm{DD}}$ (up to 3.6 V ), and the common mode range is from 1.1V to 1.6 V . In the differential encode mode, ENCshould stay at least 200 mV above ground to avoid falsely triggering the single-ended encode mode. For good jitter performance ENC ${ }^{+}$should have fast rise and fall times.
The single-ended encode mode should be used with CMOS encode inputs. To select this mode, ENC- is connected to ground and $\mathrm{ENC}^{+}$is driven with a square wave

Figure 11. Equivalent Encode Input Circuit for Single-Ended Encode Mode

Figure 13. PECL or LVDS Encode Drive

## APPLICATIONS InFORMATION

encode input. ENC ${ }^{+}$can be taken above $\mathrm{V}_{\mathrm{DD}}$ (up to 3.6 V ) so 1.8 V to 3.3V CMOS logic levels can be used. The ENC ${ }^{+}$ threshold is 0.9 V . For good jitter performance ENC+ should have fast rise and fall times.

## Clock PLL and Duty Cycle Stabilizer

The encode clock is multiplied by an internal phase-locked loop (PLL) to generate the serial digital output data. If the encode signal changes frequency or is turned off, the PLL requires $25 \mu$ s to lock onto the input clock.
A clock duty cycle stabilizer circuit allows the duty cycle of the applied encode signal to vary from $30 \%$ to $70 \%$. In the serial programming mode it is possible to disable the duty cycle stabilizer, but this is not recommended. In the parallel programming mode the duty cycle stabilizer is always enabled.

## DIGITAL OUTPUTS

The digital outputs of the LTM9011-14/LTM9010-14/ LTM9009-14 are serialized LVDS signals. Each channel outputs two bits at a time (2-lane mode). At lower sampling rates there is a one bit per channel option (1-lane mode). The data can be serialized with 16,14 , or 12 -bit
serialization (see the Timing Diagrams section for details). Note that with 12-bit serialization the two LSBs are not available-this mode is included for compatibility with 12-bit versions of these parts.

The output data should be latched on the rising and falling edges of the data clock out (DCO). A data frame output (FR) can be used to determine when the data from a new conversion result begins. In the 2-lane, 14-bit serialization mode, the frequency of the FR output is halved.

The maximum serial data rate for the data outputs is 1 Gbps, so the maximum sample rate of the ADC will depend on the serialization mode as well as the speed grade of the ADC (see Table 1). The minimum sample rate for all serialization modes is 5Msps.

By default the outputs are standard LVDS levels: 3.5 mA output current and a 1.25 V output common mode voltage. An external $100 \Omega$ differential termination resistor is required for each LVDS output pair. The termination resistors should be located as close as possible to the LVDS receiver.

The outputs are powered by $0 V_{D D}$ which is independent from the A/D core power.

Table 1. Maximum Sampling Frequency for All Serialization Modes. Note That These Limits Are for the LTM9011-14. The Sampling Frequency for the Slower Speed Grades Cannot Exceed 105MHz (LTM9010-14) or 80MHz (LTM9009-14).

| SERIALIZATION MODE | MAXIMUM SAMPLING <br> FREQUENCY, $\mathrm{f}_{\mathrm{S}}(\mathrm{MHz})$ | DCO FREQUENCY | FR FREQUENCY | SERIAL DATA RATE |  |
| :--- | :--- | :---: | :---: | :---: | :---: |
| 2-Lane | 16 -Bit Serialization | 125 | $4 \bullet \mathrm{f}_{\mathrm{S}}$ | $\mathrm{f}_{\mathrm{S}}$ | $8 \bullet \mathrm{f}_{\mathrm{S}}$ |
| 2-Lane | 14 -Bit Serialization | 125 | $3.5 \bullet \mathrm{f}_{\mathrm{S}}$ | $0.5 \bullet \mathrm{f}_{\mathrm{S}}$ | $7 \bullet \mathrm{f}_{\mathrm{S}}$ |
| 2 -Lane | 12 -Bit Serialization | 125 | $3 \bullet \mathrm{f}_{\mathrm{S}}$ | $\mathrm{f}_{\mathrm{S}}$ | $6 \bullet \mathrm{f}_{\mathrm{S}}$ |
| 1 -Lane | $16-$ Bit Serialization | 62.5 | $8 \bullet \mathrm{f}_{\mathrm{S}}$ | $\mathrm{f}_{\mathrm{S}}$ | $16 \bullet \mathrm{f}_{\mathrm{S}}$ |
| 1 -Lane | 14 -Bit Serialization | 71.4 | $7 \bullet \mathrm{f}_{\mathrm{S}}$ | $\mathrm{f}_{\mathrm{S}}$ | $14 \bullet \mathrm{f}_{\mathrm{S}}$ |
| 1 -Lane | 12 -Bit Serialization | 83.3 | $6 \bullet \mathrm{f}_{\mathrm{S}}$ | $\mathrm{f}_{\mathrm{S}}$ | $12 \bullet \mathrm{f}_{\mathrm{S}}$ |

## APPLICATIONS INFORMATION

## Programmable LVDS Output Current

The default output driver current is 3.5 mA . This current can be adjusted by control register A2 in the serial programming mode. Available current levels are 1.75 mA , $2.1 \mathrm{~mA}, 2.5 \mathrm{~mA}, 3 \mathrm{~mA}, 3.5 \mathrm{~mA}, 4 \mathrm{~mA}$ and 4.5 mA . In the parallel programming mode, the SCK pin can select either 3.5 mA or 1.75 mA .

## Optional LVDS Driver Internal Termination

In most cases, using just an external $100 \Omega$ termination resistor will give excellent LVDS signal integrity. In addition, an optional internal $100 \Omega$ termination resistor can be enabled by serially programming mode control register A2. The internal termination helps absorb any reflections caused by imperfect termination at the receiver. When the internal termination is enabled, the output driver current is doubled to maintain the same output voltage swing. In the parallel programming mode the SDO pin enables internal termination. Internal termination should only be used with $1.75 \mathrm{~mA}, 2.1 \mathrm{~mA}$ or 2.5mA LVDS output current modes.

## DATA FORMAT

Table 2 shows the relationship between the analog input voltage and the digital data output bits. By default the output data format is offset binary. The 2's complement format can be selected by serially programming mode control register A1.

Table 2. Output Codes vs Input Voltage

| A $_{\text {I }}+-$ A $_{\text {IN }}-$ <br> $(2 V$ <br> RANGE $)$ | D13-DO <br> (OFFSET BINARY) | D13-DO <br> (2's COMPLEMENT) |

## Digital Output Randomizer

Interference from the A/D digital outputs is sometimes unavoidable. Digital interference may be from capacitive or inductive coupling or coupling through the ground plane. Even a tiny coupling factor can cause unwanted tones in the ADC output spectrum. By randomizing the digital output before it is transmitted off chip, these unwanted tones can be randomized which reduces the unwanted tone amplitude.

The digital output is randomized by applying an exclusiveOR logic operation between the LSB and all other data output bits. To decode, the reverse operation is applied -an exclusive-OR operation is applied between the LSB and all other bits. The FR and DCO outputs are not affected. The output randomizer is enabled by serially programming mode control register A1.

## APPLICATIONS InFORMATION

## Digital Output Test Pattern

To allow in-circuit testing of the digital interface to the $A / D$, there is a test mode that forces the $A / D$ data outputs (D13-D0) of all channels to known values. The digital output test patterns are enabled by serially programming mode control registers A3 and A4. When enabled, the test patterns override all other formatting modes: 2's complement and randomizer.

## Output Disable

The digital outputs may be disabled by serially programming mode control register A2. The current drive for all digital outputs including DCO and FR are disabled to save power or enable in-circuit testing. When disabled the common mode of each output pair becomes high impedance, but the differential impedance may remain low.

## Sleep and Nap Modes

The A/D may be placed in sleep or nap modes to conserve power. In sleep mode the entire device is powered down, resulting in 2 mW power consumption. Sleep mode is enabled by mode control register A1 (serial programming mode), or by SDI (parallel programming mode). The time required to recover from sleep mode is about 2 ms .

In nap mode any combination of $A / D$ channels can be powered down while the internal reference circuits and the PLL stay active, allowing faster wakeup than from sleep mode. Recovering from nap mode requires at least 100 clock cycles. If the application demands very accurate DC settling then an additional $50 \mu \mathrm{~s}$ should be allowed so the on-chip references can settle from the slight temperature shift caused by the change in supply current as the $A / D$ leaves nap mode. Nap mode is enabled by mode control register A1 in the serial programming mode.

## DEVICE PROGRAMMING MODES

The operating modes of the LTM9011-14/LTM9010-14/ LTM9009-14 can be programmed by either a parallel interface or a simple serial interface. The serial interface has more flexibility and can program all available modes. The parallel interface is more limited and can only program some of the more commonly used modes.

## Parallel Programming Mode

To use the parallel programming mode, PAR/ $\overline{\mathrm{SER}}$ should be tied to $\mathrm{V}_{\mathrm{DD}}$. The $\overline{\mathrm{CS}}$, SCK, SDI and SDO pins are binary logic inputs that set certain operating modes. These pins can be tied to $\mathrm{V}_{\mathrm{DD}}$ or ground, or driven by $1.8 \mathrm{~V}, 2.5 \mathrm{~V}$, or 3.3V CMOS logic. When used as an input, SDO should be driven through a 1 k series resistor. Table 3 shows the modes set by $\overline{\mathrm{CS}}, \mathrm{SCK}, \mathrm{SDI}$ and SDO.

Table 3. Parallel Programming Mode Control Bits (PAR/SER = VDD

## Serial Programming Mode

To use the serial programming mode, PAR/ $\overline{S E R}$ should be tied to ground. The $\overline{C S}$, SCK, SDI and SDO pins become a serial interface that program the A/D mode control registers. Data is written to a register with a 16-bit serial word. Data can also be read back from a register to verify its contents.
Serial data transfer starts when $\overline{\mathrm{C}}$ is taken low. The data on the SDI pin is latched at the first 16 rising

## APPLICATIONS INFORMATION

edges of SCK. Any SCK rising edges after the first 16 are ignored. The data transfer ends when $\overline{\mathrm{CS}}$ is taken high again.
The first bit of the 16 -bit input word is the $R / \bar{W}$ bit. The next seven bits are the address of the register (A6:A0). The final eight bits are the register data (D7:D0).
If the $R / \bar{W}$ bit is low, the serial data ( $D 7: D 0$ ) will be written to the register set by the address bits (A6:AO). If the $\mathrm{R} / \overline{\mathrm{W}}$ bit is high, data in the register set by the address
bits (A6:AO) will be read back on the SDO pin (see the Timing Diagrams section). During a read back command the register is not updated and data on SDI is ignored.

The SDO pin is an open-drain output that pulls to ground with a $200 \Omega$ impedance. If register data is read back through SDO, an external 2 k pull-up resistor is required. If serial data is only written and read back is not needed, then SDO can be left floating and no pull-up resistor is needed. Table 4 shows a map of the mode control registers.

## Software Reset

If serial programming is used, the mode control registers should be programmed as soon as possible after the power supplies turn on and are stable. The first serial command must be a software reset which will reset all register data bits to logic 0 . To perform a software reset, bit D7 in the reset register is written with a logic 1. After the reset SPI write command is complete, bit D7 is automatically set back to zero.

## GROUNDING AND BYPASSING

The LTM9011-14/LTM9010-14/LTM9009-14 requires a printed circuit board with a clean unbroken ground plane. A multilayer board with an internal ground plane in the first layer beneath the ADC is recommended. Layout for the printed circuit board should ensure that digital and analog signal lines are separated as much as possible. In particular, care should be taken not to run any digital track alongside an analog signal track or underneath the ADC.

Bypass capacitors are integrated inside the package; additional capacitance is optional.

The analog inputs, encode signals, and digital outputs should not be routed next to each other. Ground fill and grounded vias should be used as barriers to isolate these signals from each other.

The pin assignments of the LTM9011-14/LTM9010-14/ LTM9009-14 allow a flow-through layout that makes it possible to use multiple parts in a small area when a large number of ADC channels are required. The LTM9011 module has similar layout rules to other BGA packages. The layout can be implemented with 6 mil blind vias and 5 mil traces. The pinout has been designed to minimize the space required to route the analog and digital traces. The analog and digital traces can essentially be routed within the width of the package. This allows multiple packages to be located close together for high channel count applications. Trace lengths for the analog inputs and digital outputs should be matched as well as possible.

## APPLICATIONS INFORMATION

Table 5 lists the trace lengths for the analog inputs and digital outputs inside the package from the die pad to the package pad. These should be added to the PCB trace lengths for best matching.
The material used for the substrate is BT (bismaleimidetriazine), supplied by Mitsubishi Gas and Chemical. In the DC to 125 MHz range, the speed for the analog input signals is $198 \mathrm{ps} / \mathrm{in}$ or $7.795 \mathrm{ps} / \mathrm{mm}$. The speed for the digital outputs is $188.5 \mathrm{ps} / \mathrm{in}$ or $7.417 \mathrm{ps} / \mathrm{mm}$.

| A | $9 / 11$ | Updated Functional Block Diagram. | 21 |
| B | $3 / 15$ | Removed mention of OGND. | 26 |
| C | $2 / 17$ | Fixed $V_{\text {CM }}$ channel pairs: $V_{\text {CM12 }}$ changed to $V_{\text {CM14, }}, V_{\text {CM34 }}$ changed to $V_{\text {CM23, }}, V_{\text {CM56 }}$ changed to $V_{\text {CM67 }}, V_{\text {CM78 }}$ <br> changed to $V_{\text {CM58. }}$. <br> Corrected pin names for ENC and OUTXX. | $18,20,21,32$, <br> 37,40 <br> $20,32,37,40$ <br> D |

## TYPICAL APPLICATION

Single-Ended to Differential Conversion Using LTC6409 and 50MHz Lowpass Filter (Only One Channel Shown).
Filter for Use at 92.16Msps

## RELATGD PARTS

| PART NUMBER | DESCRIPTION | COMMENTS |
| :---: | :---: | :---: |
| ADCs |  |  |
| $\begin{aligned} & \text { LTC2170-14/LTC2171-14/ } \\ & \text { LTC2172-14 } \end{aligned}$ | 14-Bit, 25Msps/40Msps/65Msps 1.8V Quad ADCs, Ultralow Power | 178mW/234mW/360mW, 73.4dB SNR, 85dB SFDR, Serial LVDS Outputs, $7 \mathrm{~mm} \times 8 \mathrm{~mm}$ QFN-52 |
| LTC2170-12/LTC2171-12/ <br> LTC2172-12 | 12-Bit, 25Msps/40Msps/65Msps 1.8V Quad ADCs, Ultralow Power | $178 \mathrm{~mW} / 234 \mathrm{~mW} / 360 \mathrm{~mW}, 70.5 \mathrm{~dB}$ SNR, 85dB SFDR, Serial LVDS Outputs, $7 \mathrm{~mm} \times 8 \mathrm{~mm}$ QFN-52 |
| $\begin{aligned} & \text { LTC2173-12/LTC2174-12/ } \\ & \text { LTC2175-12 } \\ & \hline \end{aligned}$ | 12-Bit, 80Msps/105Msps/125Msps 1.8V Quad ADCs, Ultralow Power | $412 \mathrm{~mW} / 481 \mathrm{~mW} / 567 \mathrm{~mW}, 70.5 \mathrm{~dB}$ SNR, 85dB SFDR, Serial LVDS Outputs, $7 \mathrm{~mm} \times 8 \mathrm{~mm}$ QFN-52 |
| $\begin{aligned} & \text { LTC2173-14/LTC2174-14/ } \\ & \text { LTC2175-14 } \end{aligned}$ | 14-Bit, 80Msps/105Msps/125Msps 1.8V Quad ADCs, Ultralow Power | $412 \mathrm{~mW} / 481 \mathrm{~mW} / 567 \mathrm{~mW}, 73.4 \mathrm{~dB}$ SNR, 85dB SFDR, Serial LVDS Outputs, $7 \mathrm{~mm} \times 8 \mathrm{~mm}$ QFN-52 |
| Amplifiers/Filters |  |  |
| LTC6412 | 800MHz, 31dB Range, Analog-Controlled Variable Gain Amplifier | Continuously Adjustable Gain Control, 35dBm OIP3 at 240MHz, 10dB Noise Figure, $4 \mathrm{~mm} \times 4 \mathrm{~mm}$ QFN-24 |
| LTC6420-20 | 1.8GHz Dual Low Noise, Low Distortion Differential ADC Drivers for 300MHz IF | Fixed Gain 10V/V, 1nV/ $\sqrt{\mathrm{Hz}}$ Total Input Noise, 80mA Supply Current per Amplifier, $3 \mathrm{~mm} \times 4 \mathrm{~mm}$ QFN-20 |
| LTC6421-20 | 1.3GHz Dual Low Noise, Low Distortion Differential ADC Drivers | Fixed Gain 10V/V, 1nV/ $\sqrt{\mathrm{Hz}}$ Total Input Noise, 40mA Supply Current per Amplifier, $3 \mathrm{~mm} \times 4 \mathrm{~mm}$ QFN-20 |
| $\begin{aligned} & \text { LTC6605-7/LTC6605-10/ } \\ & \text { LTC6605-14 } \end{aligned}$ | Dual Matched 7MHz/10MHz/14MHz Filters with ADC Drivers | Dual Matched 2nd Order Lowpass Filters with Differential Drivers, Pin-Programmable Gain, $6 \mathrm{~mm} \times 3 \mathrm{~mm}$ DFN-22 |
| Signal Chain Receivers |  |  |
| LTM9002 | 14-Bit Dual Channel IF/Baseband Receiver Subsystem | Integrated High Speed ADC, Passive Filters and Fixed Gain Differential Amplifiers |
