## feATURES

- 8th Order Filter in a 14-Pin Package
- 140kHz Maximum Corner Frequency
- No External Components
- 50:1 and 100:1 Clock to Cutoff Frequency Ratio
- $80 \mu V_{\text {RMS }}$ Total Wideband Noise
- 0.03\% THD or Better
- Operates from $\pm 2.37 \mathrm{~V}$ to $\pm 8 \mathrm{~V}$ Power Supplies

## APPLICATIONS

- Antialiasing Filters
- Smoothing Filters
- Tracking High Frequency Lowpass Filters

## DESCRIPTIOn

The LTC ${ }^{\circledR} 1064-2$ is a monolithic 8th order lowpass Butterworth filter, which provides a maximally flat passband. The attenuation slope is $-48 \mathrm{~dB} /$ octave and the maximum attenuation is in excess of 80 db . An external TTL or CMOS clock programs the filter's cutoff frequency. The clock to cutoff frequency ratio is 100:1 (Pin 10 at $\mathrm{V}^{-}$) or 50:1 (Pin 10 at $\mathrm{V}^{+}$). The maximum cutoff frequency is 140 kHz . No external components are needed.
The LTC1064-2 features low wideband noise and low harmonic distortion even for input voltages up to $3 \mathrm{~V}_{\text {RMS }}$. In fact the LTC1064-2 overall performance competes with equivalent multiple op amp RC active realizations. The LTC1064-2 is available in a 14-pin DIP or 16-pin surface mounted SW package. The LTC1064-2 is fabricated using LTC's enhanced analog CMOS Si-gate process.

The LTC1064-2 is pin compatible with the LTC1064-1.

[^0]
## TYPICAL APPLICATION

8th Order Clock Sweepable Lowpass Butterworth Filter

NOTE: THE POWER SUPPLIES SHOULD BE BYPASSED BY A $0.1 \mu \mathrm{~F}$ CAPACITOR CLOSE TO THE PACKAGE. THE NC PINS 1, 6, 8 , AND 13 SHOULD BE PREFERABLY GROUNDED.

## ABSOLUTE MAXIMUM RATINGS

(Note 1)
Total Supply Voltage ( $\mathrm{V}^{+}$to $\mathrm{V}^{-}$). $\qquad$ 16.5 V

Power Dissipation $\qquad$ 400 mW

Operating Temperature Range
LTC1064-2M (OBSOLETE) .............. $-55^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$
Storage Temperature Range ............... $-65^{\circ} \mathrm{C}$ to $150^{\circ} \mathrm{C}$
LTC1064-2C $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ Lead Temperature (Soldering, 10 sec ) $\qquad$ $300^{\circ} \mathrm{C}$

PACKAGE/ORDER INFORMATION

Consult LTC Marketing for parts specified with wider operating temperature ranges.

## PIO FUnCTIOnS (Pin Numbers Refer to the 14-Pin Package)

NC (Pins 1, 6, 8 and 13): The "no connection" pins should be preferably grounded. These pins are not internally connected.
$\mathrm{V}_{\text {IN }}, \mathrm{V}_{\text {OUT }}$ (Pins 2, 9): The input Pin 2 is connected to an 18 k resistor tied to the inverting input of an op amp. Pin 2 is protected against static discharge. The device's output, Pin 9, is the output of an op amp which can typically source/sink 3mA/1mA. Although the internal op amps are unity gain stable, driving long coax cables is not recommended.

When testing the device for noise and distortion, the output, Pin 9, should be buffered. (Figure 1) The op amp power supply wire (or trace) should be connected directly to the power source. To eliminate switching transients from filter output, buffer filter output with a third order lowpass (Figure 5).
AGND (Pins 3, 5): For dual supply operation these pins should be connected to a ground plane. For single supply operation both pins should be tied to one half supply, (Figure 3).
$\mathbf{V}^{+}, \mathbf{V}^{-}$(Pins 4, 12): Should be bypassed with a $0.1 \mu \mathrm{~F}$ capacitor to an adequate AGND. Low noise, nonswitching power supplies are recommended. To avoid latchup when the power supplies exhibit high turn-on transients, a 1N5817 Schottky diode should be added from the $V^{+}$and $V^{-}$pins to ground (Figures 1, 2 and 3).

RIN $_{\text {IN }}$ A, OUT C (Pins 7, 14): A very short connection between Pin 7 and Pin 14 is recommended. This connection should be preferably done under the IC package. In a breadboard use a one inch, or less, shielded coaxial cable: the shield should be grounded. In a PC board, use a one inch trace or less; surround the trace by a ground plane.

50/100 (Pin 10): The DC level at this pin determines the ratio of clock frequency to the -3 dB frequency of the filter. The ratio is $50: 1$ when Pin 10 is at $\mathrm{V}^{+}$and $100: 1$ when Pin 10 is at $\mathrm{V}^{-}$. This pin should be bypassed with a $0.1 \mu \mathrm{~F}$ capacitor to analog ground when it's connected to $\mathrm{V}^{-}$or $\mathrm{V}^{+}$ (Figure 1). See Tables 1 through 7 for typical gain and delay responses for the two ratios.
$\mathrm{f}_{\text {CLK }}$ (Pin 11): For $\pm 5 \mathrm{~V}$ supplies the logic threshold level is 1.4 V . For $\pm 8 \mathrm{~V}$ and 0 V to 5 V supplies the logic threshold levels are 2.2 V and 3 V respectively. The logic threshold levels vary $\pm 100 \mathrm{mV}$ over the full military temperature range. The recommended duty cycle of the input clock is $50 \%$ although for clock frequencies below 500 kHz the clock "on" time can be as low as 200ns. The maximum clock frequency for $\pm 5 \mathrm{~V}$ supplies is 4 MHz . For $\pm 7 \mathrm{~V}$ supplies and above, the maximum clock frequency is 7 MHz . Do not allow the clock levels to exceed the power supplies. For single supply operation $\geq 6 \mathrm{~V}$ use level shifting at Pin 11 with $T^{2} \mathrm{~L}$ levels (Figure 4).

## TYPICAL APPLICATIONS

Figure 2. Using Schottky Diodes to Protect the IC from Transient Supply Reversal.

Figure 1. Buffering the Filter Output. The Buffer Op Amp Should Not Share the LTC1064-2 Power Lines.

Figure 3. Single Supply Operation. If Fast Power Up or Down Transients are Expected, Use a 1 N5817 Schottky Diode Between Pin 4 and Pin 5 . For $\mathrm{V}^{+}=5 \mathrm{~V}$, Derive the Mid-Supply Voltage with a 7.5 k Resistor and an LT1004 2.5V Reference.
